HEX HEAD LAG BOLTS

PART CLASS # / 806BH / **Gimlet Point**

HEX HEAD LAG BOLTS are also called hex head lag screws and are recommended for all types of wood or metal to wood construction where standard wood or deck screws are too short or light and where nails or spikes lack sufficient strength. Hot dipped galvanized (HDG) provides one of the highest degree of corrosion-resistance of all mechanically plated fasteners. Used in all exterior applications where prolonged exposure to the elements are present.

CONELOK LOCK NUTS UNC (ZINC - WAXED)

PART CLASS # GRADE C / 800AD / **Coarse Thread**

CONELOK LOCK NUTS are a type of prevailing-torque locknut or self-locking nut. They are frictionally resistant to rotation due to localized precision deformation of the thread in the cone section on top of the nut. Grade C Conelok Locknuts are all steel one piece construction. Lock in any position and are strong, shock-proof and vibration proof. Easily installed and reusable - starts freely and then requires wrenching as the out-of-round gripping threads engage the bolt. Grade C nut strength is similar to Grade 8.

FLAT WASHERS (STEEL PLATE ZINC)

PART CLASS # 804AJ

FLAT WASHERS are great for adding resistance to your bolts and screws to prevent them from boring into the surface and weakening it. Used behind a nut or screw head to distribute load and to prevent material from buckling or screw pull-through. Washer sizes are specified by the bolt or screw diameter and should be matched to ensure proper fit. These washers are finished with zinc to be corrosion resistant. When selecting a washer, be sure to pick one that matches the fasteners you are already using. Picking a different finish may cause a chemical reaction, weakening your fasteners over time.

SPRING LOCK WASHERS BARE METAL (PLAIN)

PART CLASS # 804AT

LOCK WASHERS known as split lock washers are engineered to provide a more uniform load distribution. Ideal for situations where potential loosening from corrosion or vibration is a concern. Lock washers provide a locking spring action and are used to prevent nuts and bolts from coming loose from vibrations. They have split ends that help "lock" into the mating material, thus providing a locking feature when tightened beneath a nut.

EXTINGUISH THE FLAME!

Repairing vehicles and equipment shouldn't include damaging nearby parts, tools, your shop, your employees, or you. Collateral damage is injury inflicted on something other than an intended target. Alternatives to induction heating used to remove ferrous metal parts cause a lot of collateral damage:

- Torches burn nearby plastics, rubber, fuel lines, and wires as well as your hands
- Angle grinders create sparks that can burn down a barn when used on farming equipment
- Breaker bars and torque bits can slip and hurt you
- Knives and wires used to remove windshields and other auto glass can hurt you and break the glass
- Chemicals take a long time to work, generally don't work that well and they damage the environment

Induction heating avoids all of the collateral damage listed above.

THERSTY

THERSTY WORK MIX DRINK, SINGLE SERVE STICK PACKS

A worker performing job functions in a hot environment loses water and salt through sweat. This loss should be compensated by water electrolytes and salt intake which can help to prevent the negative impacts from heat stress and dehydration. Fluid intake should equal fluid loss. Depending on external factors and exertion, an average of approximately one litre of water per hour may be required to replace the fluid lost during work functions. Employers should provide cool drinking water and electrolyte replacements for employees working in environments that have the potential to cause dehydration and heat stress.

40 SINGLE SERVE STICK PACKS IN RESEALABLE STAND UP POUCH BAG

Usage: Pour 1 stick pack into 500-750ml (16.91 oz/ 25.36 oz) of cold water. Shake until powder has fully dissolved. Drink, hydrate, and enjoy.

WHEEL NUTS

The original lug nuts on certain vehicles have a failure-prone two-piece design that makes warping common and removal difficult. There's often a thin veneer that gets damaged with repeated use, and if moisture gets underneath it can cause the cover to bulge. Those failures can make the nuts difficult or impossible to remove, and if they get stuck, removing them usually requires damaging the wheel itself. This Dorman OE FIX replacement matches the OE fit and function but has a one-piece, carbon steel design to prevent similar issues from happening in the future.
