

# EIGHTH \* LIGHT | AGENTIC AI STUDIO

AI makes it cheaper to build software.  
It doesn't make it easier to succeed.

Most organizations have a graveyard of promising AI pilots. They looked great in the boardroom. They fell apart when they hit the real world. That gap, between a working prototype and a system your business can actually run, is where most AI investments go quiet.

**8th Light's Agentic AI Studio was built for that gap.  
One production-ready workflow, delivered in 8-12 weeks.**

## The Problem We Solve

Vibe coding is real and it's useful. It's also producing a generation of demos that look done but aren't; systems that buckle the moment they meet real users, real data, real load. Legacy architecture, security requirements that showed up after the prototype, no governance plan, and an org that was never fully bought in. We call it Prototype Theater. The demo worked great. But your production environment has notes.

## What We Deliver

A production-ready agentic workflow in 8-12 weeks

InsightMesh: a private AI substrate handling identity, orchestration, and retrieval, deployed inside your VPC, enterprise security built in from day one

Defined boundaries, human oversight, and observability from the start

Evaluation harnesses so you can trust what you're running

## Vibe-to-Value

We use agentic coding to move at the speed of AI. Then we apply 20 years of engineering discipline to make sure what we built holds up. The companies winning right now aren't just building faster. They've changed how their teams ideate, design, build, test, and launch together, with accountability at every stage. That's what we bring.

## Proof From the Field

**Pfizer:** 50% faster deployment across 20+ engineering teams

**Ticketmaster, Grubhub, Fidelity, Cars.com**  
complex, regulated, high stakes

**20 years** of production software that's still running across the apps and interfaces you shop across

## Why 8th Light

We know what to trust, what to question, and what will quietly cause problems six months from now. We design applied agent systems with defined boundaries, human oversight, security guardrails, and observability built in. We don't just build the agent. We build the operating system around it.

**YOU'RE MOVING FAST  
WE MAKE SURE IT HOLDS**
