Emojis and Intellectual Property Law

By Eric Goldman* and Gabriella E. Ziccarelli**

Everyone loves emojis, and why not? They are a fun and an increasingly ubiquitous way for people to express themselves. But despite their superficial frivolity, emojis can raise potentially complex and serious legal issues, including novel and complicated questions about intellectual property (IP). This article surveys how United States IP law protects emojis, and why such protection may be problematic.

What are emojis?

Emojis are small icons that people include in electronic communications to express an idea or an emotion.¹ Emojis play a variety of communicative roles: they can function as a word substitute, a word complement (like the emphasis provided by an exclamation mark), an emotional signal, and more. Although most emojis are static images, they can be animated.² Emojis were preceded by emoticons – icons comprised of keyboard characters such as the “smiley,” i.e., the keyboard characters :-).³ Emojis are subject to a wider range of depictions than emoticons because they can be literally anything, while emoticons are limited to keyboard characters.

Emojis can be divided into two categories: Unicode-defined emojis and proprietary emojis.

Unicode-defined emojis. The Unicode Consortium establishes standards for keyboard characters and, more recently, emojis. Unicode has assigned a unique number, a black-and-white shape outline and a short description to over 2,000 emojis.⁴ The Unicode standards enable emojis to be recognized across platforms. If both the sender’s and recipient’s platforms adopt a Unicode-defined emoji, a sender can send an emoji symbol that recipients on other platforms can recognize.

Despite the Unicode’s veneer of standardization, the emojis seen by users are not truly standardized because each platform implements Unicode-defined emojis differently. For example, some platforms adopt “house styles,” such as Google’s historical use of “blob”-shaped

² For example, Apple’s animoji feature (<https://support.apple.com/en-us/HT208190>) and Samsung’s AR emoji feature (<https://www.samsung.com/us/smartphones/galaxy-s9/augmented-reality/>).

outlines (instead of the more typical circular shapes)⁵ for emojis depicting faces (what we call “face emojis”). Other platforms implement Unicode-defined emojis in strange or quirky ways, such as Apple’s historically idiosyncratic depiction of the Unicode-defined pistol emoji as a neon green water gun.⁶ And even where platforms try to adhere to Unicode’s definitions, the way they each implement emojis still varies. For example, platforms have placed the cheese in the burger emoji in different locations – some above the burger, others below.⁷ Thus, virtually all implementations of the Unicode-defined emojis look different from each other, at least slightly.

Proprietary emojis. Platforms can also implement emojis that work only on their platforms. We call these “proprietary emojis” (other names include “stickers”). Even when proprietary emojis have similar designs to Unicode-defined emojis, they will not share the Unicode-defined numerical value for those emojis. Accordingly, when a proprietary emoji is sent outside the platform, it typically appears as a symbol such as a blank square indicating that the recipient platform did not recognize the character.

Unicode does not adopt emojis covered by third-party intellectual property, such as trademarked logos.⁸ However, these may be produced by platforms or individuals as proprietary emojis. Examples of “branded emojis” include Twitter hashtag-triggered emojis (such as NFL emoji hashtags for game day)⁹ and celebrity emoji sets like Kim Kardashian’s “Kimoji.”¹⁰

Copyright considerations

Copyright may protect individual emojis, emoji sets and “house styles.”

Individual emojis. Individual emojis, whether proprietary or platform-implemented Unicode-defined, are presumptively copyrightable as graphical images. Nevertheless, most individual emojis will not receive copyright protection for at least three reasons.

First, some emojis are so simple that they do not have enough expression to constitute a work of authorship. Also, some emoji designs are so venerable that they are not original.

Second, emojis are subject to the merger doctrine, which eliminates copyright protection when an idea can be expressed only in a limited number of ways,¹¹ and scènes à faire, which eliminates copyright protection for details that, in context, are common or expected.¹² There are only so many ways to express certain emojis, especially because emojis’ small size makes it hard to

depict many details. Also, emojis seek to communicate their ideas as universally as possible. To do so, the details of many emojis invoke standard cultural references associated with an emoji's meaning, raising the odds that the details will be *scènes à faire*. Furthermore, emojis have developed some conventions, such as depicting face emojis in bright yellow,¹³ which are now likely *scènes à faire*.

Third, though Unicode's IP policy is not crystal clear, Unicode likely either disclaims ownership or freely grants unrestricted usage of its emoji definitions. Platform-specific implementations of Unicode-defined emojis are based on the Unicode outlines, so most implementations should be derivative works of Unicode's definitions. However, some platform implementations, for example, Apple's water gun depiction of the pistol emoji, vary so significantly from Unicode's definition that they are not derivative works. For those emojis that qualify as derivative works, the platforms can only claim copyright for their incremental changes to the Unicode outline, which might be so inconsequential that they do not qualify for separate copyright protection.

In contrast, some proprietary emojis reflect significant creative judgments, in which case they will be better positioned to obtain copyright protection. Branded emojis may also be copyrightable when the source image is itself protected by copyright.

Even if an individual emoji qualifies for copyright protection, its scope of protection may be quite narrow. For example, many courts in the United States will apply the fair use defense broadly to authorize non-identical emoji implementations, and even identical depictions could qualify as fair use. Despite the graphical depictions of emojis, courts might feel like copyright law should not reach so deeply into how humans communicate.

We believe the fact that copyright might protect individual emojis has spurred platforms to create their own version of the same emojis. Does the world really need hundreds of slightly different emoji implementations of the smiley? No, but copyright law may motivate platforms to proliferate variations nonetheless.

Emoji sets. Emoji sets are collections of individual emojis. The sets may qualify for compilation copyrights if they have sufficiently original selection, arrangement and coordination.

House styles. House styles represent standard design choices implemented across an emoji set, such as the Google blob shape or a uniform non-yellow color for face emojis. A house style could provide the basis of compilation copyrights in emoji sets, and applying the style to individual emojis might help make those emojis copyrightable (or qualify as a derivative work, if they are a variation of the Unicode standard). House styles also could be part of a platform's trade dress.

Trademark considerations

Regardless of whether emojis qualify for copyright protection, as outlined above, and when they distinguish goods and services in the marketplace, they can be protected as trademarks. In such instances, multiple parties could have coexisting trademark rights in the same emoji symbols for different classes of goods. We believe that hundreds of emojis, or emoji-like symbols, have been registered as trademarks.¹⁴

However, the “use in commerce” requirement for trademark protection may prevent trademark protection for many emojis. For example, platforms typically do not make a “use in commerce” by providing free emoji sets that users can incorporate into messages. Also, where an emoji is used for its dictionary meaning (e.g., Bob’s Car seeks a trademark registration for Bob’s + a car emoji), the emoji is being used descriptively and is unlikely to qualify for trademark protection.

The possibility of trademark protection for standard and widely used emojis raises potential troubles for platforms. To reduce their trademark infringement exposure, platforms may deliberately implement emojis so that they are not substantially similar to protected trademarks – even if the platforms are not commercializing the emojis and merely providing emoji sets to their users. This effort to avoid possible trademark complications exacerbates copyright’s emoji proliferation problem.

Other IP considerations

Design patents. Emojis may be covered by design patents (industrial design rights) when they are an ornamental, nonfunctional design element of an item. For example, US patent D793,512 depicts a wink emoji on a water flotation device.¹⁵ However, platforms probably cannot obtain design patents for using emojis online because they serve the function of facilitating communication among users.

Utility patents. Emoji- and emoticon-related technologies are potentially patentable, and we are aware of at least four lawsuits involving such technologies.¹⁶ These include, for example, WordLogic v Flesky,¹⁷ which involves a patent that predicts words as mobile app users type and whether predicting emoticons would violate the patent.

Publicity rights. Proprietary emojis can depict individual faces and other attributes uniquely associated with a single person. For example, bitmojis allow people to create emojis of

themselves.¹⁸ Also, some celebrities have created emoji sets containing emojis that look like them.¹⁹ Any emoji depictions of individuals may require consent from the depicted person. Such consent is certainly required if the emoji is to be used as a brand on marketplace goods or services.

Owning emojis

Because emojis are eligible for IP protection, we expect that IP protection and assertions for emojis will increase as their popularity grows. IP protection for emojis, however, is a mixed blessing. While some emoji owners may profit from exploiting their IP, the rest of us may find it harder to communicate effectively with each other. Acquiring IP rights over emojis implicitly encourages unnecessary and undesirable variations of emoji depictions. It is as if each publisher intentionally spelled common words differently just to avoid any risk of infringement claims. Insofar as the linguistic role of emojis is analogous to words in communicative sentences, IP for emojis imposes a substantial tax on standard human communication. For these reasons, the institutions that regulate IP – courts, government registration offices and, as necessary, legislatures – need to be circumspect in determining the scope of IP protection for emojis.

EMOJIS AND THE LAW

By Eric Goldman*

Abstract: Emojis are an increasingly important way we express ourselves. Though emojis may be cute and fun, their usage can lead to misunderstandings with significant legal stakes—such as whether someone should be obligated by contract, liable for sexual harassment, or sent to jail.

Our legal system has substantial experience interpreting new forms of content, so it should be equipped to handle emojis. Nevertheless, some special attributes of emojis create extra interpretative challenges. This Article identifies those attributes and proposes how courts should handle them.

One particularly troublesome interpretative challenge arises from the different ways platforms depict emojis that are nominally standardized through the Unicode Consortium. These differences can unexpectedly create misunderstandings.

The diversity of emoji depictions is not technologically required, nor does it necessarily benefit users. Instead, it likely reflects platforms’ concerns about intellectual property protection for emojis, which forces them to introduce unnecessary variations that create avoidable confusion. Thus, intellectual property may be hindering our ability to communicate with each other. This Article will discuss how to limit this unwanted consequence.

INTRODUCTION

Emojis² are sparking a communications revolution. Emojis make it easy to incorporate visual imagery into text-based communications.³ This makes emojis a powerful and efficient way to express ourselves.⁴ The right emoji can convey emotional valence, cultural jokes, or other valuable information to a message. As Professor Vyvyan Evans has said,

expansion pack of ideograms.”¹³ A major development in human communication like this will have many far-reaching effects on society—including the law.

Emoji-related legal issues generally will fall into two broad categories. First, emojis contribute to misunderstandings that will require judicial interpretation. Second, emojis raise questions about the scope of their protection under intellectual property (IP) laws.

This Article focuses on the intersection of those two issues: how IP protection for emojis may cause avoidable misunderstandings.

The story goes like this: emojis have several unusual technical and social properties that create the risk of misunderstanding. For example, emojis have “no fixed emotional resonance, clear dictionary definition, or established grammatical rules for interpreting them in the various contexts in which they appear.”¹⁴

However, most significantly, emoji senders and recipients do not always see the same symbol (and do not know this fact). Indeed, if they communicate with each other across different devices, software programs, or operating systems (collectively, what this Article calls “platforms”), senders and recipients see emoji depictions that are almost certainly not identical. The discrepancies might be minor and inconsequential, or they could lead to major misunderstandings with life-changing consequences.¹⁵

The heterogeneity of platforms’ emoji depictions (what this Article calls “cross-platform depiction diversity”) is likely caused by IP protection for emojis. Individual emojis often qualify for copyright and trademark protection (and possibly other forms of IP protection), discouraging rival platforms from making identical emoji depictions and driving cross-platform depiction diversity.

Thus, IP protection for emojis essentially forces platforms to differentiate their emoji depictions from other platforms. The resulting depiction variations disrupt our ability to effectively communicate with each other. Several steps can be taken to reduce this unwanted

consequence, including restricting the scope of IP protection for emojis, and encouraging platforms to do more to mitigate the consequences of emoji depiction diversity.

This Article proceeds in three parts. Part I defines emojis and distinguishes them from emoticons, memes, and GIFs. Part II looks at the special interpretative challenges created by emojis and proposes steps that courts, Unicode, and dictionary publishers can take to mitigate these challenges. Part III identifies how emojis may qualify for copyright and trademark protection. It explains how IP protection encourages proliferation of unnecessary modifications to emoji depictions and interferes with effective communication. It also suggests steps that can be taken to avoid that outcome. A short conclusion follows.

Unicode is the leading organization attempting to standardize emojis. Its definition:

Emoji are pictographs (pictorial symbols) that are typically presented in a colorful cartoon form and used inline in text. They represent things such as faces, weather, vehicles and buildings, food and drink, animals and plants, or icons that represent emotions, feelings, or activities.²¹

To supplement these definitions, it is helpful to isolate some key attributes of emojis:

- Emojis initially gain recognition through use in online communications, even when their imagery comes from offline sources (such as country flags).²² Once identified as emojis online, the imagery can migrate offline.²³
- Emoji symbols are displayed at about the same size as the text characters they accompany.²⁴ Their size limits the amount of detail they can contain before they become too cluttered to decode.²⁵

Typically, emojis are static images, but they can be animated.²⁶

- Users can express emojis in one of three primary ways: (1) users select the desired symbol from a palette of options; (2) the platform automatically converts keystrokes into emojis, such as converting keystrokes <3 into ❤️; or (3) based on users' keystrokes, platforms may “auto-suggest” emojis to replace or supplement words.²⁷ Eventually, we may have emoji keys on our physical keyboards or emoji-only physical keyboards.²⁸

Emojis can be taxonomized into two classes: “Unicode-coded emojis” and “non-Unicode emojis.” Sometimes, people equate “emojis” with only emojis defined by Unicode, but numerically, non-Unicode emojis are vastly more common.

*Unicode-coded emojis.*²⁹ The Unicode Consortium “provides a unique number for every character, no matter what the platform, no matter what the program, no matter what the language.”³⁰ Platforms adopting Unicode’s standards will recognize characters sent by other adopting platforms. For example, the “j” keyboard character originating from a Unicode-compliant platform will be correctly recognized as a “j” by all other Unicode-compliant platforms. Unicode supplanted earlier character standardization efforts, such as ASCII.³¹

26. For example, Apple’s “animojis” let users include animation on about a dozen emojis that mimics their facial expressions. *Animoji*, EMOJIPEDIA, <https://emojipedia.org/animoji/> [<https://perma.cc/KFC2-Z7ZU>]; cf. *State v. Like keyboard characters, Unicode standardizes emojis. To standardize emojis, Unicode assigns a unique numerical value to each emoji symbol that all Unicode-adopting platforms recognize as being associated with that symbol.³² As of January 1, 2018, about 2,600 emoji symbols have Unicode codes.³³

Despite Unicode's ambition, Unicode only standardizes the unique emoji codes, not their depictions. When Unicode codes an emoji, it provides "a representative glyph (in a black-and-white text presentation)" for that emoji.³⁴ This means platforms can implement the glyph with any color they want, and they do not have to adhere to the glyph's shape.³⁵ Thus, each platform's implementation of Unicode-coded emojis reflects their idiosyncratic design choices.³⁶

This leads to cross-platform depiction diversity:³⁷ "Unlike plain text where people view the same characters in their exchange, platforms effectively translate emoji: the emoji that the sender chose is translated to the receiver's platform's rendering."³⁸ Further, "since emoji render

sort."). Like ASCII, Unicode provides numerical definitions of characters, but for many more characters. See generally James A. Crippen, *Bits, Bytes, and Unicode: An Introduction to Digital Text for Linguists*, LINGBUZZ (Sept. 26, 2012), <http://ling.auf.net/lingbuzz/002254/current.pdf> [<https://perma.cc/KJ6T-AD92>]. Unicode honors ASCII standards by incorporating ASCII codes into Unicode's UTF-8. See, e.g., Markus Kuhn, *UTF-8 and Unicode FAQ for Unix/Linux*, DEP'T OF COMPUTER SCI. & TECH., U. CAMBRIDGE <https://www.cl.cam.ac.uk/~mgk25/unicode.html> [<https://perma.cc/D6UF-LDTL>] (explaining this incorporation).

differently on different platforms, the emoji graphic that is sent by one person on one device may be quite different than what is seen by the recipient using a different device.”³⁹

As an illustration of cross-platform depiction diversity, this chart shows how various platforms implemented the Cow emoji.⁴⁰

The far left symbol is the Unicode-coded outline of the cow’s shape. Like most Unicode-coded emojis, it does not specify any color. The other symbols represent the implementations of eight different platforms. Some platforms depict Holstein black-and-white spotting; others depict Jersey/Guernsey brown coloring. Some platforms depict a more rotund cow outline than Unicode’s outline, and two platforms rotated the cow so that it faces the viewer more. In some depictions, the cow’s legs are spindly like the Unicode outline; others have chubbier or indistinct legs. Some platforms have added details to the Unicode outline, such as a bell around the cow’s neck, clearly marked hooves, a nose ring, or a prominent udder. Why the platforms made these deviations from, or supplements to, the Unicode outline is not self-explanatory.⁴¹ This Article will revisit that question in Part III.

Over time, platforms’ depictions of Unicode-coded emojis have moved towards convergence.⁴² But as emoji implementations converge, it makes the platforms’ small or immaterial deviations even more baffling.

Non-Unicode Emojis. Platforms routinely offer non-Unicode-coded emojis to their users. Some non-Unicode emojis look similar or identical to Unicode-coded emojis; other non-Unicode emojis have no Unicode-coded counterpart. There are less than 3,000 Unicode-coded emojis; the universe of non-Unicode emojis is surely much larger.⁴³

Non-Unicode emojis come in two main forms. First, an online service may enable emojis that work within its virtual premises. These are often called “stickers” or sometimes “bespoke emoji.” Examples include Facebook’s stickers,⁴⁴ Snapchat’s stickers,⁴⁵ Twitch’s Emotes,⁴⁶ Lego Life’s emojis,⁴⁷ Grindr’s “Gaymoji,”⁴⁸ and emojis in the financial sector.⁴⁹

Second, users may install software programs that let them send non-Unicode emoji that other users of that software can see, wherever they are on the Internet. For example, the Bitmoji app allows users to create personalized “avatars” that function across multiple platforms that are integrated with the app.⁵⁰

By definition, non-Unicode emojis do not honor Unicode’s unique codes for emojis, so other platforms are not likely to recognize them. For example, if a sender incorporates a Facebook sticker into a message that a recipient receives outside of Facebook, the sticker probably will not display properly to the recipient. In those circumstances, the recipient’s

platform may replace the incoming non-Unicode emoji with a placeholder (such as a white or black square);⁵¹ or the platform may omit the unrecognized emoji without any indication.

To recap emoji compatibility:

- Unicode-coded emojis share a common outline and short description, but implementations can differ significantly across platforms. Therefore, senders and recipients on different platforms typically will not see identical depictions of an emoji.
- Non-Unicode emojis usually are not compatible across platforms, so recipients on other platforms will see a placeholder symbol replacing the non-Unicode emoji—or nothing at all.

Emoticons. The word “emoticon” is a portmanteau of the words “emotion” and “icon.”⁵² *Merriam-Webster Dictionary* defines emoticons as “a group of keyboard characters (such as :-)) that typically represents a facial expression or suggests an attitude or emotion and that is used especially in computerized communications (such as e-mail).”⁵³ In other words, emoticons are letters, numbers and other standard keyboard characters sequenced into a pictograph.⁵⁴

Emoticons are typically associated with facial expressions.⁵⁵ One of the best-known emoticons is the “smiley” :-).⁵⁶ Other popular “face” emoticons include the “winky” ;-) and the “sad face” :-(. However, emoticons can depict more than faces, such as the “heart” emoticon <3. Emoticons are a venerable part of online communications, dating back at least to 1982,⁵⁷ and hundreds of emoticons have been defined at some point.⁵⁸

Most popular emoticons (such as the smiley or heart) have emoji analogues, and some platforms auto-correct selected emoticon keystrokes into outline drawings, such as converting the keystrokes :-) into the Dingbat symbol ☺.⁵⁹ However, most emojis do not have a commonly used emoticon equivalent.

Because the images appear horizontally, emoticons typically require a reader to tilt his or her head.⁶⁰ In contrast, kaomojis (顔文字)⁶¹ are also made of keyboard characters but do not require a head-tilt. A popular kaomoji is the “whatever” symbol _(ツ)_/ .⁶²

Emojis and emoticons play similar functions in electronic communications: they supplement text communications with visual imagery. Because of this, sometimes the two terms are confused or treated as synonymous.⁶³

However, emojis and emoticons have significant technical differences. First, emoticons are limited to imagery that can be created by standard keyboard characters. In contrast, as small graphical images, emojis can depict literally anything. Second, emojis usually look different across platforms, but emoticons will have consistent appearances because they consist of keyboard characters that are standardized across platforms.⁶⁴

Despite their differences, emojis and emoticons raise similar interpretation issues. Although this Article focuses on emojis, it will sometimes reference cases and academic research about emoticons where the similarities (e.g., the pictograph function) outweigh the differences (e.g., the cross-platform appearance).

drawings of popular images that either come from TV shows or movies or develop popularity online.⁶⁶ “Meme generators” allow users to add their own caption to the image, which multiplies and iterates the meanings associated with the image.

People incorporate GIFs and memes into social media posts to express an emotion or make a joke. Thus, GIFs and memes often perform the same communicative functions as emojis, but do so using video or larger static images. Because they are often larger than any accompanying text, GIFs and memes are typically attached to the end of messages (or sent as standalone messages) rather than interspersed with the text. Like emojis, GIFs and memes raise interpretation and IP issues, but addressing those implications is beyond this Article’s scope.

II. EMOJI MISUNDERSTANDINGS

Courts regularly interpret communications. It is a core judicial function. Interpretation questions arise in virtually every legal doctrine and legal practice area, and common law court systems have centuries of expertise interpreting communications—including non-textual content such as signs, symbols, and logos.⁶⁷

Emojis are another type of content requiring judicial interpretation. Emoji-related misunderstandings are inevitable; “when two people consider the same emoji rendering, they may interpret both the sentiment

and semantic meaning differently.”⁶⁸ Already, dozens of court opinions have referenced emojis or emoticons, and the rate is accelerating.⁶⁹

While emojis often raise routine interpretative issues,⁷⁰ emojis also can create some unexpected and novel challenges to judicial interpretative processes.⁷¹ This Part explains the communicative functions performed by emojis, surveys misunderstandings caused by emojis, and explains how courts should handle those challenges.

A. *The Many Functions of Emojis*

Emojis perform many different communicative functions. An emoji symbol might be used for different functions in the same message; or different emoji symbols might perform the same function in a single message. Thus, when interpreting an emoji, it is essential to determine the communicative function performed by the emoji.

Linguistics expert Professor Vyvyan Evans enumerates six ways emojis can perform the same functions that “non-verbal cues” perform to “enhance meaning in face-to-face spoken interaction”⁷²:

Communication Function	Non-Emoji Example	Emoji Example
Substitution	A head nod, a thumbs-up or an “OK” hand sign instead of a spoken “yes”	A smiley instead of the word “yes”
Reinforcement	A thumbs-up with a spoken “yes”	A heart emoji following a declaration of love
Mixed Message	Saying “that will be fun” in a monotone	An eye roll emoji signaling lack of sincerity
Complement	Indicating through finger motions how much liquid someone should pour into a glass	A smiley following the words “tough day” to provide emotional qualification of the text
Emphasis	Gesticulation or variation of vocal pitch	Repeating emojis, such as multiple hearts after a declaration of love ⁷³

Communication Function	Non-Emoji Example	Emoji Example
Discourse management	Periodic head nods to signal that a listener is following the speaker	<p>Emojis establish “social contact” and keep “the lines of communication open and pleasant”⁷⁴</p> <p>Ex. 1: Conversation “metacomment”: a smiley can act as an “utterance opener” to add a cheerful tone to the message, or can be an “utterance ender” to ameliorate an abrupt ending to an online message⁷⁵</p> <p>Ex. 2: Punctuation:⁷⁶ a smiley between words can “break up” sentences, like a speaker might take a breath between sentences</p>

Emojis may serve other functions beyond those identified in the chart. For example, it has been suggested that senders sometimes use emojis as tools to help them (as authors) think through their ideas as they compose their messages,⁷⁷ not to communicate the emoji's meaning to recipients.

Courts already categorize and apply emojis' functions using standard judicial interpretative tools.⁷⁸ Thus, courts can identify when "mixed message" emojis reverse the meaning of text. For example, one court determined that a smiley emoticon converted text into a joke, which caused the text to mean the exact opposite of what it said: "Christensen claims Neuhardt violated attorney-client privilege and the Sixth Amendment by offering, in an e-mail to the prosecutor accompanied by an emoticon, to 'stipulate that my client is guilty. :)' No one took Neuhardt's frivolous e-mail as an actual stipulation."⁷⁹

Another court correctly identified smileys as text supplements that enhanced the messages' emotional valence (in that case, happiness):

Ms. Scerbo began her email with a "smiley face emoticon," asking ":-)) did Ray chat with you about Elaina?" Plaintiff argues that this is a reference to Plaintiff's termination, to which Mr. Mauch responded "Yes he did. Thank you for your help. That deserves a big :-))!!!" The Court believes that a reasonable jury could find that the "emoticons," attached to the emails of two Munich Re managers late in the day on which Plaintiff was terminated, are evidence that the decisionmakers at Munich Re were happy to be able to terminate Plaintiff.⁸⁰

COMPUTER REV. 324, 343 (2001) ("Emoticons may help the writer, not the reader . . . by helping to express, to check, and if need be to edit, that which may be unclear during initial message production. As such, emoticons are not communicative but generative.").

These two rulings, and others,⁸¹ demonstrate that courts regularly interpret symbols like emojis successfully, including recognizing that a symbol (in the two cases, the smiley emoticon) can perform different communicative functions. This supports a hypothesis that many emojis pose garden-variety interpretative challenges to courts.⁸²

B. *Factors Contributing to Emoji Misunderstandings*

Nevertheless, emojis have numerous attributes that exacerbate the risks of misunderstandings. This section highlights some key attributes. While courts should be able to handle the interpretative challenges caused by these attributes, a heightened understanding of emojis' attributes will help get to the right result.

Visual Decoding. The small size of emojis can make them hard to decode.⁸³ Many emojis look similar, with only subtle distinctions between them.⁸⁴ Emoji designs likely will improve over time and screen

81. See *Ghanam*, 845 N.W.2d at 145 (“This statement on its face cannot be taken seriously as asserting a fact. The use of the ‘:P’ emoticon makes it patently clear that the commenter was making a joke. 82. Because courts interpret novel or unfamiliar communication symbols as a matter of course, generalist judges should be able to handle emoji interpretations too. For these reasons, I disfavor exceptionalist judicial treatment of emojis. For a discussion of exceptionalism treatment, see Kirley & McMahon, *supra* note 6, at 569 (advocating a “discrete legal space” and a “specialty court” for the interpretation of emojis).

83. See Hannah Miller et al., *Understanding Emoji Ambiguity in Context: The Role of Text in Emoji-Related Miscommunication*, in PROCEEDINGS OF THE ELEVENTH INTERNATIONAL AAAI CONFERENCE ON WEB AND SOCIAL MEDIA 152, 160 (2017) [hereinafter Miller, *Emoji Ambiguity*], http://www.brenthocht.com/publications/icwsm17_emojixtext.pdf [<https://perma.cc/53BB-2PXH>] (“[W]e rendered the emoji images in the survey at a size that corresponds with their typical size in common use (rather than enlarged versions for easier viewing). This proved difficult for some participants that took the survey on desktop monitors.”).

84. For example, there are more than a dozen smiling/grinning Unicode-coded emojis. UNICODE, *Full Emoji Data, v4.0*, *supra* note 40; see also ICANN SEC. & STABILITY ADVISORY COMM., SSAC ADVISORY ON THE USE OF EMOJI IN DOMAIN NAMES 5 (2017) [hereinafter SSAC Report],

resolutions will surely become better,⁸⁵ which will improve decoding accuracy. Until then, mistaken decodings can contribute to misunderstandings.⁸⁶

For example, the Unicode-coded “Smiling Face With Open Mouth & Smiling Eyes” (below left) and “Smiling Face With Open Mouth & Cold Sweat” (below right) differ only by a tiny sweat bead on the face’s right side:

A sender or recipient could reasonably miss the sweat bead,⁸⁷ which may cause reasonable senders and recipients to assign different meanings to the symbols and thereby misunderstand each other.

Emojis with Multiple Meanings. Like many words and other symbols, emojis routinely have multiple meanings. Some of that reflects ordinary linguistic evolution.⁸⁸

Remarkably, emoji ambiguity is also intentional.⁸⁹ Unicode prefers to adopt emojis that have multiple meanings.⁹⁰ It says emojis “add useful ambiguity to messages, allowing the writer to convey many different possible concepts at the same time.”⁹¹

<https://www.icann.org/en/system/files/files/sac-095-en.pdf> [<https://perma.cc/LXD6-HYUU>] (“Many emoji are visually similar and can be difficult to distinguish . . .”).

85. However, as display technology improves, the depictions of emojis will likely improve along with it. See EVANS, *supra* note 3, at 207.

86. A related risk: senders can make “typographical” errors when selecting emojis, i.e., a sender accidentally chooses the wrong emoji and does not catch the error before sending the message. Those errors might be due to a sender’s imprecise finger movements or mental error.

87. There is also the risk that a party will mis-decode the sweat bead as a tear. Another example is the Drooling Face emoji, which “on a Samsung device looks like a terrified face in such a state of shock that a littlest bit of spit—so faint, it would be hardly visible if you were to see it scrolling through your Twitter feed—has leaked from its mouth . . .” Madison Malone Kircher, *Jessica Chastain Learns the Hard Way that Not All Emoji Look the Same on Different Platforms*, N.Y. The Sleepy Face emoji poses similar problems, as the Unicode outline ☹️ has a snot bubble that is almost imperceptible and easily mistaken for a tear.

88. EVANS, *supra* note 3, at 198 (“Emojis, like words, develop new meanings, sometimes far removed from their cultural origins.”); Steinmetz, *supra* note 51 (quoting Tyler Schnoebelen as saying “Language changes . . . and emoji are changing”).

90. UNICODE, #51, *supra* note 21.

91. *Id.*

Thus, emojis routinely have multiple popular meanings.⁹² For example, the “Folded Hands” emoji⁹³ was designed to symbolize please and thank you, but it also means “I’m praying” or “high five;”⁹⁴ and the Syringe emoji⁹⁵ can mean donating blood, getting shots, “blood brothers,” or tattoo issues.⁹⁶ Small groups routinely develop their own idiosyncratic meanings, such as two spouses who “use the Easter Island head [emoji]⁹⁷ to connote absurdity.”⁹⁸ Some meanings are not readily apparent to people who are not part of the conversation, such as the “mystifying” finding that the “bento box emoji is used in largely negative contexts, while the panda face is associated with less positive emotions than most other animals featured on the emoji keyboard.”⁹⁹

Multiple emoji meanings pose a special problem because no definitive reference source catalogs the disparate meanings.¹⁰⁰ Unicode provides a

short description of every emoji it defines,¹⁰¹ but Unicode acknowledges that its descriptions “may not encompass all the possible meanings of an emoji character, and in some cases may even be misleading.”¹⁰² Unicode does not catalog slang usage well (or at all). The leading supplement, Emojipedia,¹⁰³ inconsistently includes some slang definitions of emojis.¹⁰⁴ Other resources, such as the “Emoji Dictionary,”¹⁰⁵ are not very helpful. Traditional dictionary publishers have historically ignored emojis. Dictionary.com recently started publishing definitions and explanations of emojis,¹⁰⁶ but as of April 2018, their resource only covered about two dozen emojis.¹⁰⁷

The absence of emoji dictionaries creates extra interpretative challenges, such as:

- *New Emojis*. New emoji symbols are constantly emerging, and each one will have a transitional period before it achieves widespread consumer recognition.
- *Combined Emojis*. Unicode allows some emoji combinations or modifications to change colors (such as skin tones) or genders.¹⁰⁸ This expands the universe of emojis to create symbols recipients

104. For example, Emojipedia’s definition of the “100” emoji includes:

100 emoji: the number one-hundred, written in red, underlined twice for emphasis. Originating from the number 100 written on a school exam or paper to indicate a perfect score of 100 out of 100. Teachers in Japan may also use a stamp in addition to the 100 mark, to indicate that a student has performed very well. This 100 emoji is commonly used as a shorthand for 100%, with the usage meaning “keep it real” or a similar sentiment. A 100 emoji can be used to express pride or general acceptance of an idea. In Snapchat, the 100 emoji appearing next to a fire emoji indicates a 100 day Snapstreak.

may not recognize or understand. Further, as illustrated with the Jolly Roger example *infra* section II.D, the combination or modification may fail technically, causing senders and recipients to see different things.

- *Unsophisticated User Groups*. Emojis are still working through the adoption curve, so some user communities still are not familiar with them. There also may be generational differences in emoji usage.¹⁰⁹
- *Depiction Diversity*. Due to platform-specific emoji implementations, users must learn multiple variations of each symbol; this means users will routinely encounter unfamiliar variations. It is like having to learn a dozen different spellings of the same word, where each spelling is correct only on one platform.

Unsettled Grammar Rules. When multiple emojis are sequenced together, there are no clear rules for interpreting the sequence.¹¹⁰ As Professor Evans explained, the “emerging Emoji grammar is some considerable way from a true grammar I might know how to use and send emojis, [but] I don’t know how to combine them in a way that is grammatical.”¹¹¹ Without universally accepted grammar rules, senders and recipients could reasonably apply different grammar rules to emoji sequences that lead to misunderstandings.¹¹²

Face Emojis. Emojis depicting the faces of people or animals (what this Article calls a “face emoji”) deserve special consideration because they represent a majority of emoji usage¹¹³ and pose extra interpretative challenges.¹¹⁴ Face emojis are a major way that senders signal mixed

messages, such as facetiousness, sarcasm, or parody. However, those mixed messages can be misconstrued in the best of circumstances,¹¹⁵ and they are especially risky given the inherent ambiguity of facial expressions codified in face emojis.

For example, the following image depicts Apple’s “Unamused Face” emoji. If a sender uses it, what emotion was the sender trying to communicate?

If you are not sure, you are not alone.¹¹⁶ A survey revealed that people considered this emoji to signal “disappointment,” “depressing,” “unimpressed,” or “suspicious.”¹¹⁷ With such a disparate range of possible emotional meanings, the risks of misunderstanding are high.

The “Unamused Face” emoji’s ambiguity is not unique. Researchers found that each of the top three most confusing face emojis (by platform) generated “significantly different responses from the participants for a given rendering,” with the “Smirking Face”¹¹⁸ ranking in the top three on four of the five platforms tested.¹¹⁹

People also routinely disagree on whether a face emoji indicates positive or negative emotional valence. The same survey indicated that 25% of the time, people did not agree whether an emoji’s emotional valence was positive, neutral, or negative.¹²⁰ For Microsoft’s implementation of “Smiling Face With Open Mouth And Tightly Closed Eyes,”¹²¹ “44% of participants labeled it as negative and 54% labeled it as

positive, indicating a clear lack of consensus.”¹²² Given these statistics, the sender and recipient would attach different emotional meanings to that particular symbol about half of the time.

People have difficulty decoding facial expressions even in optimal circumstances. Due to their prevalence, face emojis will cause many misunderstandings.

C. *Emoji Dialects*

As the prior section indicates, emojis can have multiple meanings and convey different emotional valences. This section takes a closer look at some of the reasons why emojis develop dialects—different meanings in different communities—and how those factors can further exacerbate emoji misunderstandings.

Culture-Specific Meanings. Professor Evans observes that “just as language reflects cultural knowledge and variation, so too do emojis.”¹²³ Thus, accurately decoding emojis requires an understanding of the cultural context surrounding the conversation.¹²⁴ Where the sender and recipient have different cultural knowledge, misunderstandings are likely to follow.¹²⁵

Emojis, and their emoticon cousins—despite all the reasons for their popularity—should have no place in business communications in the global and culturally diverse environment.”).

A few examples of culture-specific meanings for emojis:

- The Face Mask emoji¹²⁶ might symbolize illness in Japan and bank robbery in the United States.¹²⁷
- The Eggplant emoji¹²⁸ can be a phallic reference in the United States.¹²⁹
- In Western cultures, cat emojis are associated with domestic companions; other cultures may view cats as sacred or edible.¹³⁰
- Canadians use the Poop emoji¹³¹ as an ironic commentary about the world’s overall crummy state.¹³²

A metonym is “a word, name, or expression used as a substitute for something else with which it is closely associated.”¹³³ Using the phrase “White House” to reference the U.S. president is a metonym.¹³⁴ Emojis frequently act as metonyms. For example, the “See No Evil” monkey emoji¹³⁵ can represent the concept of willful blindness or a decision not to take any action;¹³⁶ and in discussions about cellphones, a Skull emoji¹³⁷ symbolizes how being without connectivity is like death.¹³⁸

138. Schnoebelen, *supra* note 70.

Emoji metonyms depend on cultural knowledge. Without that background, outsiders will misunderstand the reference. For example, Japanese users may use a Bank emoji, some versions of which contain the letters “BK,”¹³⁹ to express the concept of “bakkureru,” slang for evading one’s responsibilities.¹⁴⁰ Properly deciphering this usage requires knowing the meaning of “bakkureru” and its cultural significance, its association with the acronym BK, and the association between the Bank emoji and BK.

Cultural considerations also affect how people assign emotional valence to emojis. Of “the 20 most frequently used emoji, nearly all are hearts, smilies, or hand gestures—the ones that emote.”¹⁴¹ However, emojis do not convey emotion clearly.¹⁴² As one commentator observed, “efforts to build a unified emotional context for hundreds of emojis used by millions of people around the world have failed.”¹⁴³ As just one example, among native Arabic speakers, the smiley emoticon does not indicate happiness or joy; it is used “for something more superficial and maybe even to hide anger or sarcasm.”¹⁴⁴ Thus, when emojis are used to signal emotion—their most popular application—they create significant risk of cross-cultural misunderstanding.

Platform-Specific Meanings. While the formation of geographic and cultural emoji dialects might seem inevitable, it may be less obvious that emoji dialects also form within platforms.

Platforms are natural boundaries for dialect formation because the platform’s software provides common user experiences and shared reference points. Emojis accelerate this process because each platform implements emojis (Unicode-coded or not) differently.¹⁴⁵ The differences between emoji depictions can prompt the development of platform-specific meanings for emojis that users on other platforms do not understand.

A celebrated platform-specific slang example is Apple's Peach emoji,¹⁴⁶ which became a euphemism for a human "butt."¹⁴⁷ On platforms that implement the Peach emoji differently,¹⁴⁸ the Peach emoji will not develop that association. Anyone unfamiliar with the Apple platform idiosyncratic meaning may misunderstand the associated message.

A platform's "auto-suggest" also contributes to platform-specific dialect formation by making suggestions unrelated to the Unicode short description. For example, Apple's iOS suggests the "Hugging Face" emoji¹⁴⁹ when users type "jazz hands" or "hugs."¹⁵⁰ The auto-suggestions might teach users to make those associations for the "hugging face" emoji, while platforms without equivalent auto-suggestions will not develop these additional meanings.

D. Depiction Discrepancies

The prior section described several emoji attributes that can lead to reasonable senders and recipients misunderstanding each other. In all of these examples, the misunderstanding can occur although the senders and recipients see the identical emoji symbol.

This section turns to a different and more troubling problem where emoji senders and recipients see different things *and do not realize this discrepancy*. There are three technological circumstances where this phenomenon occurs: (1) when the sender and recipient are on the same platform but using different generational versions of its software, (2) when the sender sends a Unicode-coded emoji to a recipient on a different platform, and (3) when the sender sends a platform's non-Unicode emoji to a recipient on a different platform.

146. 🍑. For a short time, Apple indicated it would move away from a butt-like depiction, but it abandoned that plan. See Romain Dillet, *Apple Brings Back the Peach Butt Emoji*, TECHCRUNCH (Nov. 15, 2016), <https://techcrunch.com/2016/11/15/apple-brings-back-the-peach-butt-emoji/> [<https://perma.cc/6MMG-AUE6>].

148. See 🍑 *Peach*, EMOJIPEDIA, <http://emojipedia.org/peach/> [<https://perma.cc/XL7Q-KNHV>]. For example, Google's Peach emoji is a different color (a light maroon, like a red radish's color), has bigger leaves, a smaller "crack," and a white spot suggesting the reflection of light: 🍒.

149. 🤗.

150. Another emoji, "Open Hands," can also mean "jazz hands" or "hugs," but Apple's auto-suggestion does not suggest the "Open Hands" emoji. I'm grateful to Gabriella Ziccarelli for educating me about this jazz hands/hugs example.

Intra-Platform Discrepancies. Platforms routinely revise and evolve their emoji implementations. For example, iterations of the “Grinning Face with Smiling Eyes” emoji¹⁵¹ on the Apple, Google, and Microsoft platforms have, over time, looked like this:¹⁵²

Note: These figures get older from top to bottom.

For Apple, the bottom depicts iOS 6.0 and the top depicts iOS 10.0. The mouth shape and teeth are strikingly different. For Google, the bottom represents Android 4.3, the middle Android 4.4, and the top Android 7.0. The differences between 4.4 and 7.0 are subtle, but the outline shape, mouth shape, teeth, and the relative position of eyes to mouth have all changed. The differences between 4.3 and 4.4 are dramatic: different color, outline shape, mouth and teeth, and antennae. For Microsoft, the bottom is Windows 8.0, the middle is Windows 8.1, and the top is Windows 10 Anniversary Update. The addition of color is the main change from 8.0 to 8.1, but the changes from 8.1 to 10 were significant, including the mouth shape, teeth, eyes, and the thick outline border.

If the sender and recipient are on the same platform and using the same version of the operating system (e.g., both sender and recipient are on iOS 10.0), they should see the exact same image.

In contrast, if the sender and recipient use different versions of the platform’s operating system, the emoji implementation seen by the sender and recipient may differ. For example, if the sender is on iOS 10.0 and the

recipient is on iOS 6.0, then they will see different emoji implementations as depicted above. On the Android platform, this phenomenon is called “Android fragmentation.”¹⁵³

This discrepancy—silently introduced by the platform and possibly unknown to the sender and recipient—can lead to misunderstandings.¹⁵⁴ In the iOS 6.0/10.0 example, one study showed that people interpreted the iOS 6.0 implementation as meaning “ready to fight”¹⁵⁵—a very different meaning than the short description (“grinning face with smiling eyes”) or the sender’s likely meaning of the iOS 10.0 version.¹⁵⁶

Cross-Platform Discrepancies. As discussed earlier, each platform implements Unicode-coded emojis idiosyncratically, which leads to cross-platform depiction diversity. The Cow emoji illustrated the phenomenon, but every Unicode-coded emoji has similar platform-specific discrepancies—some of which are unpredictable or even baffling.¹⁵⁷ To show how wacky this situation has gotten, consider the depiction diversity *within Facebook-owned properties*: “Facebook and Messenger now use one unique emoji set (unless you’re on iOS), WhatsApp uses a second (if you’re running the Android beta) and Instagram uses whatever the default is on the phone.”¹⁵⁸

Unicode acknowledges the problems caused by cross-platform depiction diversity. With respect to “[d]irection (whether a person or object faces to the right or left, up or down),” it says “a change in direction can change the meaning: when sending 🐊🔫👮 ‘crocodile shot by police’, people expect any recipient to see the pistol pointing in the same direction

157. One baffling example: the platforms depict the Unicode-coded “Calendar” (top) and “Tear-Off Calendar” (bottom) emojis with different dates from each other (and within the same platform, some depict the calendar and tear-off calendar with different dates). Why?

See UNICODE, *Full Emoji Data, v4.0*, *supra* note 40. as when they composed it.”¹⁵⁹ Otherwise, it might be interpreted as a threat on law enforcement if the pistol is pointed towards the police officer. However, as discussed *infra*, Unicode has little ability to force platforms to depict the pistol pointing left.

This discretion means platforms can implement Unicode-coded emojis in ways that can have substantially different meanings than the implementations on other platforms. In turn, when Unicode-coded emojis travel across platforms, and the recipient platform substitutes in its emoji implementation for the emoji as depicted on the sender’s platform, the result can be that the substitution changes the message’s meaning. In other words, cross-platform depiction diversity can create misunderstandings that would not exist for any other reason.¹⁶⁰ Furthermore, neither the sender’s nor the recipient’s platform indicate that the substitution has occurred, so both senders and recipients may be unaware that they are seeing something different than their communication partner. Some examples to illustrate this phenomenon:

Example #1: “Grinning Face With Smiling Eyes.” This Article already discussed the Unicode-coded “Grinning Face With Smiling Eyes”¹⁶¹ emoji, which creates the potential for intra-platform misunderstandings as platforms have evolved its design in ways that may change its meaning.

This emoji also can cause trouble across platforms due to cross-platform depiction diversity. A survey¹⁶² revealed that people thought Google’s implementation¹⁶³ meant “blissfully happy” but thought Apple’s implementation meant “ready to fight.”¹⁶⁴ Accordingly, a Google sender using the “Grinning Face With Smiling Eyes” emoji may inadvertently communicate a physical threat to any Apple recipient.

164. 🤪. As depicted above, Apple changed its implementation after this study was conducted.

Example #2: “Astonished Face.” This chart shows how platforms implemented the Unicode “Astonished Face” emoji.¹⁶⁵

The Unicode outline is on the far left. Google’s implementation is the third from the left. It does not resemble the Unicode outline at all; the outline shape, eyes, and mouth are all different. As a result, recipients are not likely to interpret this implementation as “astonished.” Facebook Messenger’s implementation is in the middle. It uses Xs as eyes,¹⁶⁶ a depiction typically associated with death,¹⁶⁷ so a Facebook Messenger user receiving this emoji could take it as a threat.¹⁶⁸ Samsung’s implementation is to the immediate right of Facebook Messenger’s, and it might be more associated with anger, shock, or annoyance than astonishment.

Example #3: “Pistol.” This chart shows how platforms have implemented the Unicode “Pistol” emoji.¹⁶⁹

The Unicode outline is again on the far left. Unlike the Astonished Face, the pistol implementations are fairly similar—except for Apple’s (second from the left), which intentionally substituted a water pistol for a firearm pistol.¹⁷⁰

As this Article was going to press, several major platforms chose to emulate Apple’s water gun depiction of the Pistol emoji, reducing the risks of misunderstanding, though the implementations still have substantial differences in details. See Jeremy Burge, *All Major Vendors Commit to Gun Redesign*, EMOJIPEDIA (Apr. 27, 2018), <https://blog.emojipedia.org/all-major-vendors-commit-to-gun-redesign/> [<https://perma.cc/F34Z-ZSUB>].

Like the prior examples, Apple’s idiosyncratic implementation creates the possibility that an Apple sender intends a fun message and a non-Apple recipient interprets the message as a physical threat.

Apple’s Pistol emoji implementation has garnered criticism. As Professor Jonathan Zittrain observed, Apple’s substitution “breaks the conceptual compatibility that Unicode is meant to establish.”¹⁷¹ It is also easy to see how Apple users could develop a platform-specific slang meaning for the Pistol emoji unknown to users on other platforms.

Apple’s pistol divergence is not an unusual situation. There are many other examples where a single platform’s emoji implementation—for no apparent good reason—substantially deviates from the otherwise relatively homogeneous implementations of other platforms. For example, Samsung implements the “Person Bouncing Ball” emoji with a player spinning a basketball (and thus no bouncing) and the “Cookie” emoji with a depiction of two crackers.¹⁷² All of these divergences—where a platform “goes rogue” from all other platforms—creates substantial misunderstanding possibilities and establishes the potential for platform-specific slang.

Example #4: The Jolly Roger. The fourth and final example of cross-platform depiction diversity comes from Unicode itself.¹⁷³

The set of supported emoji sequences may vary by platform. For example, take the following emoji ZWJ¹⁷⁴ sequence:

171. Jonathan Zittrain, *Apple’s Emoji Gun Control*, N.Y. TIMES (Aug. 16, 2016), <http://www.nytimes.com/2016/08/16/opinion/get-out-of-gun-control-apple.html> (last visited Sept. 5, 2018).

173. UNICODE, #51, *supra* note 21.

174. “ZWJ” stands for “zero width joiner,” which allows the combination of emoji symbols or the modification of their designs. *Id.* In this case, the grey flag and the skull-and-crossbones emojis are being combined into a single emoji.

An analogous issue arises with Unicode characters that had been coded before Unicode coded emojis, such as the chess pawn. When Unicode codes the emoji, platforms can select between the legacy Unicode character or the new emoji depiction, meaning that senders might see the character and recipients might see the emoji (or vice-versa). See Jeremy Burge, *A Chess Piece Is Emojified*, EMOJIPEDIA BLOG (Feb. 15, 2018), <https://blog.emojipedia.org/a-chess-piece-is-emojified/> [https://perma.cc/6MGS-4CBK].

On a particular platform, it can be shown as a single image:

However, if that combination is not supported as a single unit, it may show up as a sequence like the following, and the user sees no indication that it was meant to be composed into a single image:

The integrated pirate flag image (sometimes called the “Jolly Roger”)¹⁷⁵ is often used as a metonym for pirate-related connotations. However, a recipient who receives the grey flag and skull-and-crossbones emojis might legitimately interpret the message as a physical threat. Other failed “ZWJ” combinations or emoji modifications could have similar consequences.¹⁷⁶

A 2016 study demonstrates the unnecessary risks of misunderstanding from cross-platform depiction diversity.¹⁷⁷ The researchers asked survey respondents to plot emoji symbols on a grid based on two attributes: whether the emoji represented high or low energy (the vertical axis) and whether the emoji conveyed positive or negative emotion (the horizontal axis). The survey then compared the platforms’ different implementations of the common emoji symbol to see how respondents ranked them differently.

The following chart is the plot map for the “Grimacing Face” emoji.¹⁷⁸ The orange circles represent users’ assessments of the Android 5.0 implementation; the blue triangles represent users’ assessments of Apple’s iOS 8.0 implementation.¹⁷⁹

See UNICODE, *Full Emoji List, v11.0*, *supra* note 10.

179. Tigwell & Flatla, *supra* note 177.

As this chart indicates, most users characterized the Android implementation as high energy and negative emotion. In contrast, the iOS implementation had placements in all four quadrants. Though most users characterized it as high energy, there was a split of opinion about whether it was positive or negative. Thus, an Android sender intending to communicate a high energy/negative emotion message with the Grimacing Face emoji had a substantial chance of sending a positive emotion, and possibly low energy, message to iOS recipients.

The “Sleepy Face” emoji¹⁸⁰ had similar problems:¹⁸¹

On both platforms, most users characterized the Sleepy Face emoji as no or low energy. However, most users characterize the iOS implementation as negative emotion, while the Android implementation

180. Unicode’s outline: 😴.

181. Tigwell & Flatla, *supra* note 177, at 5.

is more frequently characterized as no or positive emotion. This discrepancy in perceived emotional valence between the two implementations creates substantial grounds for sender/recipient misunderstanding.¹⁸²

Collectively, these plot maps reinforce the risks that Unicode-coded emojis traveling between platforms will look differently to senders and recipients, and will be understood differently by them. The results will be avoidable misunderstandings attributable to cross-platform depiction diversity.

Cross-Platform Omissions. The Jolly Roger example illustrates another potential risk due to technology mediation of emojis: that an emoji will render properly on one platform and not another. Improper rendering will routinely occur when non-Unicode emojis travel across platforms.¹⁸³ In some circumstances, the recipient of a non-Unicode emoji from another platform will get an indication—such as an empty or black square—that a non-Unicode emoji was omitted.¹⁸⁴ Otherwise, the recipient will not be notified of the omission.¹⁸⁵ Thus, the received message does not display potentially essential parts of the sender’s expression—without any warning to the recipient. The risk of misunderstanding in those circumstances is high.

E. *The Law of Interpreting Emojis*

The prior section identified numerous ways that senders and recipients may attach objectively reasonable but different meanings to the same emojis, creating misunderstandings.¹⁸⁶ How will the law resolve these misunderstandings?

183. Undisclosed omissions can also occur when recipients use screen readers, which may omit emojis if alternative text is not provided. See generally *'Loudly Crying Face': Your Cute Emojis Are Spoiling Social Media for Blind Users*, CBC RADIO (Jan. 19, 2018), <http://www.cbc.ca/radio/spark/381-the-bad-design-behind-hawaii-s-missile-scare-internet-freedom-in-iran-and-more-1.4491385/loudly-crying-face-your-cute-emojis-are-spoiling-social-media-for-blind-users-1.4491393> (last visited Sept. 18, 2018).

186. See generally Miller, *Blissfully*, *supra* note 38 (giving examples of where this has happened).

Emojis as Evidence. Every interpretation depends critically on the admissible evidence. For emojis, threshold considerations include what evidence is considered relevant and how it is presented.

Any emoji interpretation should consider the context for the communications in question,¹⁸⁷ including the entire exchange of messages. This context might indicate, for example, that the parties developed an idiosyncratic meaning for the emoji that should be used instead of any prevailing meanings for the emoji. Also, the emoji must be considered in conjunction with any associated text¹⁸⁸ (and if it is in a string of emojis, in conjunction with those other emojis), not in isolation. Factfinders should be careful about presuming the meaning of any specific emoji; the parties should be allowed to present evidence of its meaning.¹⁸⁹

Due to cross-platform depiction diversity, any emoji interpretation must be based on the emoji versions actually seen by the parties. Because emoji depictions evolve over time, this may require research to find out what emojis looked like at the relevant time period. Furthermore, often the interpretation should consider two (or more) versions of each emoji: the version seen by the sender plus the version(s) actually seen by recipients. This is true even if the sender and recipients were on the same platform because they may have been using different software versions of the platform's software.

Presenting this evidence to the factfinder raises an additional concern. For example, in the "Silk Road" trial,¹⁹⁰ prosecutors orally read text messages to jurors and skipped any reference to the emojis, but the judge eventually required prosecutors to orally characterize the emojis.¹⁹¹ Was there a better way to handle this?

Ordinarily, criminal defense counsel "want a complete, unedited version of an online communication considered as evidence rather than

one without emojis.”¹⁹² However, that creates the risk that the factfinder also will see material that would distract or bias the jurors.¹⁹³ Then again, oral characterization of emojis may be imprecise and could be affected by vocal inflections.¹⁹⁴ Excluding emojis from trial evidence hinders accurate interpretations.¹⁹⁵ Courts are most likely to make the most accurate interpretations when factfinders can see emojis with their own eyes.

The Law of Misunderstandings. Once the proper emoji evidence is before the interpreter, then the matter turns to the applicable substantive law. Most legal doctrines have internal doctrinal tools to resolve misunderstandings. For example, in criminal law, a sender’s subjective definition of an emoji might negate a high scienter requirement like intent—even if the recipient decoded a different meaning from the emoji, and even if the sender’s subjective definition was objectively unreasonable. If an emoji, in context, is capable of multiple reasonable meanings, that might further protect the sender from any knowledge or even recklessness scienter requirements.

Contract law also has tools for resolving misunderstandings, typically illustrated by the classic “Peerless” case.¹⁹⁶

The following hypothetical might illustrate the emoji equivalent of two ships with the name “Peerless.” In the course of contract negotiations, the sender responds to a contract offer with text that could be interpreted as acceptance (such as “OK” or “awesome”)¹⁹⁷ but adds a Unicode-coded emoji intended to send a mixed message of sarcasm, and reasonable senders would interpret that emoji as communicating sarcasm. When the recipient platform implements the emoji differently, the recipient sees a different emoji depiction that does not communicate sarcasm in the same way. Due to the undisclosed emoji depiction substitution, the recipient reasonably does not perceive the sender’s intended sarcasm, believes the

sender accepted the offer, and detrimentally changes her position based on that belief.

Now what? The Restatement 2d of Contracts § 20 says:

- (1) There is no manifestation of mutual assent to an exchange if the parties attach materially different meanings to their manifestations and
 - (a) neither party knows or has reason to know the meaning attached by the other; or
 - (b) each party knows or each party has reason to know the meaning attached by the other.
- (2) The manifestations of the parties are operative in accordance with the meaning attached to them by one of the parties if
 - (a) that party does not know of any different meaning attached by the other, and the other knows the meaning attached by the first party; or
 - (b) that party has no reason to know of any different meaning attached by the other, and the other has reason to know the meaning attached by the first party.¹⁹⁸

In the hypothetical, the parties' misunderstanding is attributable to the intermediation of technology, i.e., cross-platform depiction diversity of emojis combined with the undisclosed emoji substitution. Because neither sender nor recipient realized the technology caused their different interpretations of the emoji, § 20(1)(a) indicates the contract fails. That would be an unfortunate outcome for any party that detrimentally relied upon the apparent contract formation.

However, if one party knows about cross-platform depiction diversity and the other does not, § 20(2) indicates the knowing party may lose.¹⁹⁹ Thus, the parties' respective knowledge about how emojis work will be a relevant inquiry.

What about situations, like the cross-platform omission, where the emoji is omitted but the recipient gets some notice of its omission, like a black or white square? Courts could say that the indicator puts the recipient on inquiry notice to investigate the omission, in which case their failure to inquire would render the recipient liable for the misunderstanding. However, many recipients would view the indicator as a glitch, not a prompt to clarify the sender's meaning. Thus, a reasonable

A subsequent message from the prospective tenant:

Tuesday we're moving the apartment. Maybe
Wednesday? By then Nir will have corrected the contract :)

The lease did not get signed Wednesday. Instead, the tenant stopped responding to the landlord. The landlord put the apartment back on the market and found another tenant.

The small claims court judge awarded the landlord approximately \$2,200 in damages, explaining (paragraph breaks inserted):

This is the place to refer once again to those graphic symbols (icons) sent by Defendant 2 to the Plaintiff. As stated, they do not, under the circumstances, indicate that the negotiations between the parties have matured into a binding agreement.

However, the sent symbols support the conclusion that the defendants acted in bad faith. Indeed, this negotiation's parties' ways of expression may take on different forms, and today, in modern times, the use of the "emoji" icons may also have a meaning that indicates the good faith of the side to the negotiations.

The [emoji laden] text message sent by Defendant 2 on June 5, 2016, was accompanied by quite a few symbols, as mentioned. These included a "smiley", a bottle of champagne, dancing figures and more. These icons convey great optimism. Although this message did not constitute a binding contract between the parties, this message naturally led to the Plaintiff's great reliance on the defendants' desire to rent his apartment. As a result, the Plaintiff removed his online ad about renting his apartment.

Even towards the end of the negotiations, in the same text messages sent at the end of July, Defendant 2 used "smiley" symbols. These symbols, which convey to the other side that everything is in order, were misleading, since at that time the defendants already had great doubts as to their desire to rent the apartment.

The combination of these—the festive icons at the beginning of the negotiations, which created much reliance with the prosecutor, and those smileys at the end of the negotiations, which misled the Plaintiff to think the defendants were still interested in his apartment—support the conclusion that the defendants acted in bad faith in the negotiations.

Even if I assume that the reason for the withdrawal from the negotiations was justified, the defendants should have notified the Plaintiff on 8 July, 2016 that they are not sure of their desire to

rent the apartment, and that the Plaintiff should consider his steps accordingly. The defendants “dragged” the Plaintiff, “lulled” him, until he found himself close to the beginning of the lease period without having found a renter.²⁰³

The Israeli court concluded that the parties did not form a contract, and U.S. courts would likely reach that conclusion as well. However, the Israeli court awarded damages to the landlord based on an obligation for prospective contracting parties to negotiate in good faith.²⁰⁴ U.S. law rarely imposes that obligation, so this case would likely reach a different outcome in the United States.

Applying Israeli law, the court said the emojis “support the conclusion that the defendants acted in bad faith.” That conclusion seems dubious. While the prospective tenant’s messages suggest some stalling, the emojis themselves do not necessarily demonstrate bad faith.

The court said that the smiley in the first message [“Good morning 😊”] helps “convey great optimism.”²⁰⁵ In light of the multiple functions of emojis, there are other plausible—or even likely—functions the smiley was performing. The emoji might be emphasizing the “good” in “good morning;” or more likely, the emoji is performing discourse management by setting a cheerful tone or acting as punctuation.

The tenant’s message also displayed six sequenced emojis: a Dancing Woman (also called the Red Dress Woman or Salsa Dancer); Two Women With Bunny Ears (also called the Dancing Girls emoji); the Victory Hand (also called the Peace Sign emoji); a Comet; a Chipmunk; and a Bottle With Popping Cork. The court treated these emojis as reinforcing the prospective tenant’s enthusiasm for the lease.

But do the emojis reinforce the text? We lack some key pieces of information.

First, we do not know the exact versions of the emojis seen by the landlord and prospective tenant. Unlike most opinions, this court actually displayed the subject emojis in the opinion. However, the court did not confirm that the emojis depicted in the opinion were the versions either party saw.²⁰⁶ The emojis versions seen by the prospective tenant may have contradicted any perceived bad faith.

Second, the court assumed that the six emojis might have celebratory or optimistic meanings, but this assumption is incomplete. We do not

know the emojis' meanings in Israel or the context of real estate lease transactions.

In the United States, the Bottle, Dancing Woman, and Women With Bunny Ears emojis sometimes signal celebration or joy. But what about the other three emojis? The judge cannot overlook them when interpreting the message, just like judges cannot ignore words in the text. The remaining three emojis do not clearly convey optimism about the transaction. The Victory or Peace Hand signal *might* stand for victory in the sometimes-arduous search for housing, but other explanations are possible. In context, the Comet and (especially) the Chipmunk do not have a single obvious implication.²⁰⁷

Third, we do not know how to interpret the emoji sequence. The emojis may be independent of each other, they may be sequenced to tell a story, or one or more emojis might modify the other emojis. If one or more emojis serves the mixed message function, it might completely reverse the message's meaning. So, the mystery about the Comet and Chipmunk meanings takes on greater importance. If one or both were intended to signal sarcasm or negativity, the court interpreted the message wrong.

The lack of definitive grammar rules increases the speculative nature of this discussion. Does the order of the emojis matter? Perhaps the Comet modifies the Chipmunk or vice versa?²⁰⁸

With respect to the two later text messages, both of which contained smiley emoticons without the nose, the court may have incorrectly decoded the emoticons' function. The smiley emoticons might have been intended to signal that the deal was still on. Another plausible reading is that they were used as discourse management to blunt what the landlord might have interpreted as bad news (the prospective tenant's continued delays). Alternatively, the emoticons may have signaled embarrassment over the delay, or the usage may have been facetious.

Despite the court's dubious interpretation of the emojis and emoticons, the court's conclusion may be correct. Buyers (in this case, the prospective tenant) often string along vendors (in this case, the landlord), forcing vendors to decide if they should wait for the buyer or move on. To keep the landlord from pursuing other tenants, the prospective tenant signaled continued interest through repeated positive expressions of interest. The emojis and emoticons were essentially irrelevant to that

conclusion; the court probably would have found bad faith even if the text messages had no emojis or emoticons.

G. Reducing Emoji Misunderstandings

So far, this Part has enumerated many ways that emojis can create misunderstandings. However, misunderstandings are routine with new communications media. Typically, these problems fade over time through a combination of improved user sophistication (including education), voluntary industry initiatives, and incremental legal responses. This section looks at options that could help reduce misunderstandings.

The Platforms' Role. Currently, consumers have few good ways to reduce the risk of cross-platform misunderstandings.²⁰⁹ Instead, they are functionally dependent on platforms to address this issue for them.

To reduce misunderstandings, platforms could license each other's emoji implementations and then show users how their messages will look on the recipient's platform.²¹⁰ For example, a sender's platform could warn the sender that the recipient will see a different emoji implementation and give them the option to see what the recipient will see, and the recipient's platform could warn the recipient that the sender saw a different emoji implementation and give them the option to see it.²¹¹

Even better, if the platforms cross-license emoji sets, a platform could deliver the emoji depiction that the sender sent, rather than substituting in the recipient platform's emoji implementation. This would eliminate the confusion that comes from the sender and recipient seeing different things. It might also reduce the development of platform-specific dialects.

209. For example, consumers can "jailbreak" their phones to install emoji sets from other operating systems (a process also called "rooting"), but this requires some technical sophistication and risks voiding the phone's warranty. See David Nield, *How to Use iOS Emojis on Android*, TECHRADAR (Aug. 5, 2016), <https://www.techradar.com/how-to/phone-and-communications/mobile-phones/how-to-use-ios-emojis-on-android-1326089> (last visited Sept. 18, 2018).

210. Third-party software could also perform this function, but only for users who choose to install it. See Paul Hollinsky, *Emojily*, GOOGLEPLAY, <https://play.google.com/store/apps/details?id=com.hollinsky.emojily&hl=en> [<https://perma.cc/3KG3-QFSU>] (letting Android users "input a string of text and emoji, and it will show you what an iOS user would see").

211. See Miller, *Blissfully*, *supra* note 38, at 267 (suggesting that platforms could do more to help recipients see the version that the sender saw).

Some platforms, including EmojiOne²¹² and Twitter,²¹³ have made their emoji sets available for free licensing. Thus, other platforms can already have the capacity to show incoming EmojiOne and Twitter emojis as the sender saw them.

The availability of freely-licensed emoji sets has other advantages. It might inspire other platforms to do the same, perhaps leading to an outcome where all platforms can cross-license emoji sets freely. Alternatively, perhaps many or most platforms will adopt one of the freely-licensed emoji sets rather than maintaining their idiosyncratic implementations. Either outcome would effectively eliminate cross-platform depiction diversity.

Legal liability could redress misunderstandings caused by cross-platform depiction diversity. Platforms' emoji substitution implicitly constitutes a form of misrepresentation. In effect, the recipient's platform puts "words" into the sender's mouth that the sender did not utter. If confusion results, arguably it is the platform's fault. The law could fix that.

There are relatively few comparable circumstances where senders and recipients misunderstand each other solely due to intermediating technology. Though not directly analogous because of humans "in the loop," a similar issue came up often in the telegraph context.²¹⁴

Telegraphy providers mediated messages between senders and recipients, and sometimes their operators made transmission errors that led to recipients getting incorrect messages without either the senders or

214. In response to drafts of this Article, a number of people suggested an analogy to Google Translate or other electronic translation services. If a person voluntarily runs messages through an automated translator and gets inaccurate translations back, that person has taken the risk. That is also true if a sender or recipient voluntarily configures their technology to automatically translate their outgoing/incoming messages. The more apt analogy would be if a platform automatically but surreptitiously translated inbound/outbound messages without disclosing the intermediation to either side. I am not aware of any legal cases addressing that circumstance, nor do I know of any technology currently doing this.

recipients realizing it.²¹⁵ When a telegraph operator introduced errors into the messages, it could be liable for those errors in some situations.²¹⁶ However, courts often mitigated the sting of liability through limits on damages.²¹⁷

If platforms are analogizable to telegraphy providers, there may be some basis for holding platforms liable for the undisclosed emoji substitution. That liability exposure would prompt the platforms to make immediate changes.

However, legal liability probably is not a good solution. First, platforms might negate the risk by providing unhelpful warnings or imposing contract limitations. Second, such liability might squelch platform experimentation with emoji designs, stifling innovation. Third, and most importantly, Part III will explain the IP risks driving cross-platform depiction diversity, which possibly exposes platforms to liability for copying other platforms' depictions. Unless the IP risks are ameliorated, legal liability for emoji substitution may effectively force platforms into a no-win situation where they face legal risks no matter what they do.

Even if they do not face legal risks for emoji substitution, platforms should do more to eliminate potential cross-platform misunderstandings. Otherwise, their inaction hinders our ability to communicate effectively with each other and degrades user trust. Platforms also can easily do more to prevent intra-platform discrepancies²¹⁸ and cross-platform omissions.

215. A common fact pattern involved the telegraphy provider mis-transmitting a seller's price quotation, prompting the recipient to place an order at the incorrect low price.

Unicode's Role. Unicode's attitude about cross-platform depiction diversity is, at best, lackadaisical. Unicode says:

[A]ny pictorial representation of a [Unicode outline], whether a line drawing, gray scale, or colored image (possibly animated) is considered an acceptable rendition for the given emoji. However, a design that is too different from other vendors' representations may cause interoperability problems.²¹⁹

Unicode apparently thinks those interoperability problems are not its concern. Yet, Unicode could, and should, be a catalyst to avoiding them.²²⁰ Three ways Unicode could help reduce cross-platform depiction diversity:

- Unicode could provide more detailed and specific outlines, which might inhibit platform deviations. Unicode could also specify emoji colors.
- Unicode could sanction platforms that make implementations with material variations from the official Unicode outline, such as Apple's water gun implementation of a pistol firearm. However, Unicode does not have any mechanism to impose sanctions, so this option is not currently available. Still, if a platform's implementation substantially changes an emoji's meaning, Unicode should require the platform to stop using the Unicode-assigned number for that emoji. In other words, Apple can offer its users a water gun emoji; it just cannot do so using Unicode's unique number assigned to the Pistol emoji.
- Unicode could coordinate licenses between platforms to let each other use their emoji implementations. This would let platforms show the senders' emoji depictions to recipients.

Dictionaries' Role. The public urgently needs authoritative emoji dictionaries. Without them, it is not possible to look up an unfamiliar emoji's meaning.²²¹ Also, it will be challenging to establish an emoji's historical meaning, for example in a 2025 court case interpreting an emoji's 2018 meaning.

219. UNICODE, *Frequently Asked Questions*, *supra* note 2.

220. See Miller, *Blissfully*, *supra* note 38, at 267 (suggesting that Unicode should do more to standardize platform implementations).

221. A reverse Google image search does not resolve any ambiguity about meaning. See *Search for Images with Reverse Image Search*, GOOGLE SEARCH HELP, <https://support.google.com/websearch/answer/1325808?hl=en> [<https://perma.cc/7LYN-XJMY>]. Instagram also allows searches of emojis accompanied by a hashtag, but it does not resolve meaning ambiguity. See DeFabio, *supra* note 92.

The small and tentative move by Dictionary.com has been a helpful start. Ideally, other traditional dictionary publishers will recognize emojis' importance and expand their existing dictionaries to cover them.²²² To supplement traditional dictionaries, crowdsourced dictionaries (like Urban Dictionary)²²³ could capture the wide-ranging slang meanings of emojis.

III. HOW INTELLECTUAL PROPERTY CAUSES EMOJI MISUNDERSTANDINGS

The prior Part explained how misunderstandings can arise from emojis. Some of those misunderstandings are caused by the heterogeneity of emoji depictions, i.e., cross-platform diversity depiction. Standardization of emoji depictions would reduce or eliminate some factors contributing to misunderstandings, though other factors would remain. In a sense, emoji depiction standardization would eliminate some “easily” avoidable misunderstandings, and that would improve emojis' communicative functions.

Accordingly, this Part considers an antecedent question: why are all emoji depictions not standardized? What value does cross-platform depiction diversity serve? Standardized emoji symbols would seemingly reduce or eliminate many misunderstandings. Meanwhile, platforms incur costs to create and maintain their own proprietary implementations.²²⁴ Why have emoji sets veered towards heterogeneity and proliferation rather than convergence and standardization?

These questions are a great emoji mystery. It is only possible to speculate about why cross-platform depiction diversity exists. Some possible hypotheses:

- Platforms historically developed and maintained their own emoji sets. Thus, the current diversity could be an artifact of historical decisions,²²⁵ and the industry will progressively migrate towards future standardization that it has not reached yet.

222. Any emoji dictionary must have a reverse image search to be useful.

225. Unicode's initial emoji set cobbled together several precedent emoji sets. Bosker, *supra* note 37. That created a transitional period where platforms progressively adopted Unicode's emoji set. However, this does not explain why they each did so idiosyncratically, nor does it explain why greater

- Platforms deviate from Unicode’s standards to advance their brands, such as Apple’s depiction of the headphones emoji as Apple EarPods.²²⁶
- The divergences reflect platforms’ normative values, such as Apple’s decision to display a squirt gun instead of a realistic pistol.²²⁷
- The divergences reflect platforms’ experimentation with user interfaces and design. Platforms constantly tinker with their user interfaces to improve their users’ experiences. In theory, experimentation by multiple platforms might help the most effective implementations to emerge²²⁸ and then become adopted as industry-wide standards.
- Platforms adopt and maintain house styles to create a distinctive look-and-feel within the platform that acts as a product differentiator and customer-retention feature.²²⁹ As evidence of this hypothesis, Japanese telecom company DoCoMo invented emojis but was denied Japanese copyright protection for their emoji set; yet DoCoMo’s competitors chose to implement their own emoji sets rather than adopt DoCoMo’s public domain emoji set.²³⁰ Furthermore, some platforms may view emoji-related features, such as Apple’s animoji function, as key competitive differentiators that increase consumer loyalty.²³¹ Because decoding differently depicted emojis takes time and mental energy, and because consumers may become emotionally attached to particular ways that emojis look, a platform could even view emoji set customization as a way of locking in consumers who would incur those costs to switch to rivals.

It is possible to find some support for each hypothesis, and it is likely that the real story is a combination of hypotheses rather than just one.

However, this Part emphasizes another hypothesis: that cross-platform depiction diversity is caused by an IP-rights thicket surrounding emojis. Individual emojis are potentially protectable under several intellectual property rights,²³² including copyright, trademark, design patents,²³³ and publicity rights.²³⁴ What if emoji depictions proliferate to navigate around this thicket of IP rights?

The story goes like this: platforms deliberately make their emoji implementations look different from everyone else's implementations to (a) become eligible for IP protection for their idiosyncratic implementations, or (b) more likely, reduce the risk of being sued for IP infringement by someone else.²³⁵ Copyright and trademark protection applies both to verbatim copying and similar variations (in copyright law, the test is "substantially similar," in trademark law it is "confusingly similar").²³⁶ Thus, platforms seeking to avoid IP infringement will need to make their implementations sufficiently different from the implementations of all other platforms²³⁷; platforms may be basing their

Emoji designs have appeared in issued design patents. *See, e.g.*, Water Float, U.S. Patent No. D793,512 S (a water flotation device where one side features a winky emoji design); Portion of a Display Panel with Smiley-face Icon, U.S. Patent No. D703,224 S; Portion of a Display Panel with an Ambiguous Facial Expression Icon, U.S. Patent No. D703,683 S; Display Screen with Icon, U.S. Patent No. D682,882 S (depicting four face emojis with the caption "frenemies"); Display Screen with an Icon, U.S. Patent No. D645,880 S. There are likely hundreds of others.

234. Unicode-coded emojis may not depict anyone living or dead, so they are unlikely to create publicity rights issues. However, users of the Bitmoji app can make customized emojis of people's faces, creating potential publicity rights issues. *See* BITMOJI, <https://www.bitmoji.com/> [<https://perma.cc/P7AK-UNTJ>].

decisions on their perceptions of risk, even if the actual risk of litigation is low.²³⁸

As evidence of the plausibility of this hypothesis, IP owners have occasionally enforced their IP rights in emojis. For example, in 2018, Apple shut the door to its app store for apps that made specified unwanted uses of Apple’s emoji set, citing its copyright interests.²³⁹ Apple’s move forced all offending app developers to create their own emoji sets or adopt someone else’s emoji sets. In other words, Apple’s move discouraged app developers’ efforts to standardize on Apple’s emoji set.

Thus, if this story is correct, then IP law causes the proliferation of unnecessary differences in emoji implementations that reduce IP risk but increase user misunderstanding. In other words, IP is hindering emojis’ use as tools for effective communication.

This Part will review copyright and trademark protection for individual emojis and for emoji sets. It will then discuss the problems created by IP protection and possible ways to ameliorate these unwanted consequences.

A. *Copyright for Individual Emojis*

Individual emojis may be protectable as copyrightable works. Copyright law protects “pictorial, graphic, and sculptural works,”²⁴⁰ including “two-dimensional . . . art”²⁴¹ As two-dimensional art, individual emoji designs presumptively qualify for copyright protection.²⁴² The U.S. Copyright Office has registered many individual emojis.²⁴³

Nevertheless, sorting through the scope of copyright protection for emojis is complicated. It is impossible to categorically describe which individual emojis qualify for copyright protection. To analyze the

question requires a review of (among other things) copyrightability and limitations on copyrightability such as: the idea/expression dichotomy, merger and *scènes-à-faire*, ownership, and fair use. This section now discusses those considerations.

Overview of Copyrightability. Copyright applies to two-dimensional art, even fairly simple renderings. For example, corporate logos are copyrightable if they satisfy “the requisite qualifications for copyright” and embody “some creative authorship in its delineation or form.”²⁴⁴ However, there is no bright-line test for how much detail is required to make two-dimensional art copyrightable.

Copyrightability of Emoticons. The Copyright Office Compendium says:

As a general rule, the mere arrangement of type on a page or screen is not copyrightable However, if the arrangement produces an abstract or representational image, such as an advertisement that uses letters to create a representation of a person, the Office may register the claim provided that the resulting image contains a sufficient amount of pictorial expression.²⁴⁵

Individual emoticons are very simple graphical images. The most popular emoticons are made up of just two or three keyboard characters. These simple emoticons likely lack the amount of “pictorial expression” necessary to become works of authorship. In contrast, extremely complicated emoticons might clear the threshold.

Copyrightability of Emojis. Although emojis frequently have more detail than emoticons, emojis may be quite simple. For example, Unicode’s, “Face Without Mouth”²⁴⁶ consists of one circle with two dots. In contrast, other Unicode-coded emojis are quite detailed, such as “Clown Face,”²⁴⁷ “Lion Face,”²⁴⁸ “Bento Box”²⁴⁹ and “Stadium.”²⁵⁰

Typically, individual characters in a typeface are not copyrightable.²⁵¹ The Copyright Compendium says that the U.S. Copyright Office

244. COMPENDIUM OF U.S. COPYRIGHT OFFICE PRACTICES § 913.1 (3rd ed. 2017) [hereinafter COPYRIGHT COMPENDIUM]; 37 C.F.R. § 202.10 (2017).

“typically refuses claims based on individual alphabetic or numbering characters”²⁵² But despite the fact that Unicode attempts to standardize both characters and emojis, emojis are often more complex than characters in a typeface. Most emojis are original, pictorial art and routinely contain more design elements, and impart more meaning, than individual letter or number characters. Therefore, emojis should not be considered equivalent to individual typeface characters for copyright purposes.

Though Unicode emoji outlines are intentionally simple by design, most outlines are sufficiently detailed to qualify for copyright protection. Even simple emojis, such as most face emojis, are probably copyrightable.²⁵³ More complex emojis are even more likely to be copyrightable.²⁵⁴ Platform-specific implementations of Unicode outlines often add color and additional details to the outline,²⁵⁵ which increases their copyrightability even if the associated Unicode outline is not copyrightable.

Even if a work clears the initial copyrightability threshold, there are many other factors to consider when determining if the work can be successfully enforced and by whom.

Idea/Expression and Merger. Copyright protects only the expression of ideas, not the ideas themselves.²⁵⁶ This principle is called the “idea/expression dichotomy,” and it represents the primary dividing line between patents, which protect ideas, and copyrights, which protect expression.²⁵⁷ As glyphs, emojis express ideas; they do not constitute the ideas themselves. Therefore, presumptively, emojis should be on the expression side of the idea/expression dichotomy.

However, the merger doctrine limits copyrightability when there is “only one way or only a limited number of ways to express a particular idea, procedure, process, system, method of operation, concept, principle, or discovery.”²⁵⁸ This is germane to the copyrightability of the many

emojis that are visual metaphors.²⁵⁹ For those emojis, Unicode has limited options for expressing visual clues to the metaphor. Indeed, a Unicode-coded emoji must be “generic enough to relate to a category of entities . . . [but] not be too general so that it fails to relate to the category in question.”²⁶⁰

For example, recall the “Face Without Mouth” emoji. Within Unicode’s design parameters,²⁶¹ there are only a few ways to express this idea. Many other Unicode outlines, especially face emojis, may pose similar copyrightability problems because of the overlap of idea and expression.²⁶²

Platforms also face significant design limitations when implementing Unicode-coded emojis, given that their platform-specific designs should honor the Unicode outlines. Nevertheless, platforms are free to introduce color and details that are not in the Unicode outlines, and they have shown a willingness to deviate from major aspects of the Unicode outlines. Therefore, platforms can implement most Unicode emoji outlines in a wide range of ways. This Article has already shown this phenomenon first-hand through the Cow, Astonished Face, and Pistol examples. This is the basis of the cross-platform depiction diversity discussed in this article. This makes platform-specific implementations of Unicode emoji outlines less likely to encounter merger problems.²⁶³

Scènes-à-Faire. The *scènes-à-faire* doctrine says copyright does not “protect stock characters, settings, or events that are common to a particular subject matter or medium because they are commonplace and lack originality.”²⁶⁴ Thus, details in emojis that are stereotypical or routine may not contribute to the emojis’ copyrightability.²⁶⁵

Mr. Blehm’s copyright also does not protect Penmen poses that are attributable to an associated activity, such as reclining while taking a bath or lounging in an inner tube . . . These everyday activities, common anatomical features, and natural poses are ideas that belong to the public domain; Mr. Blehm does not own these elements.”); *Design Basics, LLC v. Lexington Homes, Inc.*, 858 F.3d 1093, 1102 (7th Cir. 2017) (no copyright protection for designs that share many “attributes driven by ‘consumer expectations’”).

For example, clown faces often have a bulbous nose, exaggerated lipstick, and crazy hair.²⁶⁶ Discounting those details in the Unicode Clown Face emoji, the remaining details look less substantial. Indeed, to make Unicode outlines widely understandable, the designs frequently rely on routine or stock elements.²⁶⁷ Thus, *scènes-à-faire* undoubtedly prevents the copyrightability of some Unicode outlines. Similarly, yellow-colored emoji faces have become standard,²⁶⁸ so yellow coloring may not contribute to an emoji’s copyrightability.

Summary of Copyrightability. Several overlapping doctrines will limit copyrightability for some individual emojis. Nevertheless, because of the expansive nature of copyrightability, it is likely that many individual emojis—including Unicode outlines, platform-specific implementations, and non-Unicode emojis—are copyrightable.

Ownership of Unicode-coded Emojis. Assuming an individual emoji qualifies as copyrightable: who owns it?²⁶⁹ In the case of Unicode-coded emojis, answering the question requires parsing overlapping ownership interests between Unicode outlines and platform-specific implementations.

With regard to ownership of Unicode outlines, the Unicode Consortium does not expressly state its position.²⁷⁰ It says that Unicode “is not a designer or purveyor of emoji images” and disclaims ownership of the emojis in the various platforms that have implemented the outline.²⁷¹

What does the Unicode Consortium's ownership position mean? It is not clear which (if any) outlines were created by Unicode; the remainder presumably were created by third parties and provided to Unicode under unspecified license terms.

In terms of Unicode outlines' copyright and ownership status, the possibilities include:

- Unicode emoji outlines are not copyrightable and thus in the public domain;
- Unicode emoji outlines are copyrightable, but Unicode (or its licensors) has dedicated its copyright interests to the public domain;
- Unicode's emoji outlines are copyrightable, but Unicode (and its licensors) freely licenses the outlines to all users.

How does this affect platforms' claims for copyright of their implementations of Unicode outlines? If the Unicode outlines are public domain, platforms still could have copyrights in their implementations if they add sufficient original material to qualify for copyrightability.²⁷²

If Unicode outlines are copyrightable and Unicode and its licensors have not disclaimed the copyrights, platforms can own their specific implementation only as derivative works of the outlines, subject to any terms in the licensing agreements permitting creation and dissemination of the implementations.²⁷³

In this circumstance, Unicode and its licensors could require platforms to conform strictly to the outlines as a condition of creating derivative works. This might reduce or eliminate cross-platform depiction diversity because unauthorized implementations would expose the platforms to copyright infringement.

However, a strict copyright enforcement position by Unicode alternatively might *exacerbate* cross-platform problems in one of two ways. If a platform felt it needed to create idiosyncratic emoji depictions (for whatever reason), it might opt-out of Unicode altogether and convert to non-Unicode emojis. Or, a platform might feel compelled to make such radical changes to the Unicode outlines that it cannot be accused of copying or creating derivative works of those outlines, leading to more situations like Apple's water gun implementation of the Pistol emoji

272. Compare *L. Batlin & Son, Inc. v. Snyder*, 536 F.2d 486, 492 (2d Cir. 1976) (holding that banks' depictions of Uncle Sam, who is in the public domain, were not copyrightable), with *Alfred Bell & Co. v. Catalda Fine Arts*, 191 F.2d 99, 102–03 (2d Cir. 1951) (holding that mezzotint engraving was copyrightable despite the source material being in the public domain).

273. 17 U.S.C. § 103(a).

outline. Perhaps Unicode’s relaxed copyright position with regard to derivative works does more good than harm.

Because platforms base their implementations on Unicode outlines, platforms can only claim copyright for their idiosyncratic modifications or additions to the outlines. To be copyrightable, a “derivative work” must have changes that, “as a whole, represent an original work of authorship.”²⁷⁴ Accordingly, minor variations to the emoji outline, such as the addition of a single color and slight changes to a few details, may not be enough to make the changes copyrightable. Doctrines like merger and *scènes-à-faire* could further limit the copyrightability of a platform’s implementation of emojis.²⁷⁵ In contrast, platform implementations that significantly deviate from the Unicode outline have a greater likelihood of qualifying as a copyrightable derivative work owned by the platform (though at the cost of standardization and possible user understandability).

This table recaps the copyright ownership possibilities for Unicode-coded emojis and their platform-specific implementations:

	Platform Changes Copyrightable	Platform Changes Not Copyrightable
Unicode/Licensors Own Emoji Outline Copyright	Unicode/licensors own emoji outlines; platform owns derivative works	Unicode/licensors owns emoji outlines; platform has no separate copyright interests
Emoji Outlines Not Protected by Copyright	Platform owns its implementation as modification of public domain material	Emojis are public domain

Infringement. If an emoji is copyrightable, then the copyright owner can enforce against both identical and “substantially similar” copying.²⁷⁶ However, for copyrighted works with few details, courts usually construe the copyright narrowly against non-identical copying. As a court said in a dispute over the copyrightability of stick figure drawings: “we must be careful not to grant Mr. Blehm a monopoly over all figures featuring black

lines representing the human form. Our analysis cannot be so generous as to sweep in all manner of stick figures as potentially infringing on his works.”²⁷⁷ In many cases, minor variations in emojis will be enough to avoid infringement claims.²⁷⁸

Fair Use. If the plaintiff establishes a prima facie case of infringement, the secondary use may still be excused as fair use.²⁷⁹ Fair use protects potentially infringing uses of copyrighted works based on four statutorily-specified factors: the purpose and character of the use; the nature of the copyrighted work; the amount and substantiality of the portion used; and the effect of the use upon the potential market for or value of the copyrighted work.²⁸⁰ However, fair use is an equitable, multi-factor, and fact-specific defense, so its availability will depend on the specific circumstances.²⁸¹

It is likely many potentially infringing uses of individual emojis will qualify as fair use.²⁸² Emojis are small works of visual art, which means that they are not easily referenced without depicting the entire work. Furthermore, as discussed below, individual emojis play an important role facilitating communication. Copyright law can undermine that role if it restricts people from referencing an emoji for its accepted meaning or forces depiction diversity, which would create misunderstandings.

Conclusion on Copyright. Many individual emojis are eligible for copyright protection, but doctrines like the idea/expression dichotomy, merger, *scènes-à-faire*, and fair use make it hard to predict exactly when emoji copyrights could be successfully enforced. It is also unclear if the copyright owner would be Unicode, the platform implementing the emoji outline, both, or neither.

B. Trademarks in Emojis

Any “word, name, symbol, or device” is potentially eligible for trademark protection.²⁸³ This broad scope includes emojis. For example, although “there is evidence of the widespread, ornamental use of the smiling face design that would lead consumers to believe that it is not serving a trademark function,”²⁸⁴ it is possible to develop protectable trademark interests in a smiley face.²⁸⁵ At the same time, widely recognized emojis could be categorically generic,²⁸⁶ or, if they become trademarked, they are at constant risk of genericide when consumers interpret the symbols for their generic meaning rather than as source identifiers of any individual vendor.

Unlike copyrights, the limited expression in an individual emoji does not inhibit trademark protection (so the Face Without Mouth emoji, which may not be copyrightable, could qualify for trademark protection). The U.S. Patent and Trademark Office has issued trademark registrations for emoji designs.²⁸⁷ Also, brand owners can create or license non-Unicode emojis (sometimes called “branded emojis”) incorporating their trademarked designs or logos.²⁸⁸

Emojis become protectable trademarks only when they distinguish goods or services in the marketplace (the use-in-commerce requirement).²⁸⁹ The use-in-commerce requirement plays a crucial gatekeeping role in trademark law. Using emojis in editorial contexts,

such as platforms providing emoji sets to their users or users adding emojis to their non-commercial communications, will not satisfy the use-in-commerce requirement. Instead, to claim trademark protection for an emoji, the putative trademark owner must actually display the emoji as part of promoting their marketplace offerings, such as in advertising copy.²⁹⁰

The use-in-commerce requirement also means that trademark ownership accrues to whomever makes the requisite use in commerce; that may be a different party than the emoji's copyright owner. However, if the emoji symbol is also copyrighted, then the putative trademark owner will likely need permission from the copyright owner to avoid committing copyright infringement.

Trademark rights usually accrue only in market niches where the owner made a use in commerce. Accordingly, multiple parties can have trademark rights in the same emoji design, just like there are many overlapping trademark owners for generic terms like "apple," "national," "sun," and "united."

An emoji trademark will restrict other parties from using the trademarked emoji in their own product-promotion efforts. This restriction covers the use of both identical and confusingly-similar emojis.²⁹¹ It is unclear how to apply trademark law's "confusingly similar" legal standard to situations like the platform-specific implementations of Unicode-coded emojis. If Unicode successfully standardized emojis, platform-specific implementations *should* look similar to each other.

Although emojis are protectable by trademark law, most users' use of emojis—such as adding emojis to non-commercial social media messages—typically will not constitute trademark infringement. Trademark law usually requires that the alleged infringer used the trademark commercially. However, because trademark law's definition of commercial activity is unclear, and as the number of emojis protected by trademark law grows rapidly, there will be an increasing amount of trademark disputes over identical or confusingly-similar emojis.²⁹²

290. *Id.* Trademark use in commerce occurs "on goods when . . . it is placed in any manner on the goods or their containers or the displays associated therewith or on the tags or labels affixed thereto . . . and . . . on services when it is used or displayed in the sale or advertising of services . . ." *Id.*

Sleekcraft Boats*, 599 F.2d 341, 351 (9th Cir. 1979) (explaining that even if two trademarks have the same meaning, differences in "sight" or "sound" could nevertheless cause consumers to distinguish the two depictions).

C. *Ownership of Emoji Sets*

In addition to individual emojis, emoji sets may be protectable as well.

Copyrightability of Emoji Sets. Platforms may be able to claim copyright protection for their emoji sets.²⁹³ Third-party IP owners might also create emoji sets using their existing brands and then license those sets to platforms, such as the Pusheen²⁹⁴ or Peanuts²⁹⁵ stickers on Facebook.

Copyright law views emoji sets as compilations, and compilations are protectable when their selection, arrangement, or coordination demonstrates sufficient authorship.²⁹⁶ Simply mirroring Unicode's emoji set would not create a copyrightable compilation, but some emoji sets are highly curated. For example, the children-focused social network, Lego Life, eliminated all emojis that could be construed negatively.²⁹⁷ That kind of editorial curation might support a compilation copyright.

However, compilation copyrights provide only limited protection—perhaps only protecting against verbatim (or near-verbatim) copying of the compilation's selection, arrangement, or coordination.²⁹⁸ Thus, other users probably can develop non-identical emoji set compilations without infringing a compilation copyright.

Copyright Protection for House Styles. Platforms also may be able to claim a copyright in their “house styles”: the idiosyncratic design elements they use consistently across their emoji sets.²⁹⁹ For example, Google uses a half-moon/“gumdrop” outline for its face emojis instead of

Unicode's circle outline³⁰⁰; and Microsoft uses a thicker outline for its emojis than other platforms.³⁰¹

A house style's rulesets perform the same function as typefaces.³⁰² Typefaces are defined as "a set of letters, numbers, or other symbolic characters with repeating design elements that are consistently applied in a notational system that is intended to be used in composing text or other combinations of characters."³⁰³ Both typefaces and house styles modify Unicode-standard characters for display. Emoji house styles modify graphical images, not standard characters, but the rulesets are equally abstract. Typefaces are not copyrightable,³⁰⁴ suggesting that emoji house styles are not copyrightable either.

More likely, house styles will not be independently copyrightable, but they may contribute to the copyrightability of individual emojis and might help bolster the copyrightability of emoji sets as compilations.

Trademark Protection for House Styles. Apart from the trademarkability of any individual emoji, a platform's house style can be trademarkable (most likely as trade dress) because it defines the platform's "family of trademarks."³⁰⁵ This trademark could restrict others from commercially replicating the house style, even on emojis that the trademark owner has not implemented.

D. *Emoji Ownership Hinders Communication*

As this Part has shown, emojis will qualify for copyright and trademark protection. This creates an ever-growing thicket of IP rights around emojis. IP thickets are not new, but this particular thicket has unusually important implications for human communication. Because of the stakes involved, the key players in the IP system, including the Copyright Office, Trademark Office, and courts, must apply IP law to emoji legal issues with heightened care and thought. This section explains why those IP

institutions should interpret IP laws to exclude emojis as much as possible.³⁰⁶

IP law thwarts emojis' communicative potential in several ways. First, emojis have the capacity to transcend existing language barriers and be understood by speakers of diverse languages³⁰⁷ (or even illiterate people). However, if IP law drives unnecessary depiction diversity, it creates a new "language" barrier of platform-specific dialects.³⁰⁸

Second, IP's monopoly-style protection is generally justified by its production of social welfare benefits,³⁰⁹ but preventing the standardization of emojis across platforms undermines human communication with few or no countervailing social benefits accruing to the IP owners.³¹⁰ To communicate accurately across platforms, people must learn the meaning of many different variations of the same "words"³¹¹ or suffer the frustrations and social losses occasioned by misunderstandings due to the depiction diversity.³¹² Thus, IP should facilitate standardization of emojis, but instead it causes forking.

Like words and short phrases, emojis cannot be divided into smaller components that communicate the same meaning. Indeed, emojis and words/short phrases can substitute for each other.³¹³ Thus, like words and

short phrases, emojis act like communication building blocks for larger messages in sentences and paragraphs.³¹⁴

This makes IP protection for emojis more of a doctrinal anomaly than a routine application of the IP doctrines. Trademark law protects words and short phrases, but only against limited commercial activity. Copyright law does not protect words and short phrases at all.³¹⁵ Yet, trademark and copyright often will protect emojis, despite their analogous status as key expressive building blocks.³¹⁶ Property-like control over the smallest building-block units of communication is historically unprecedented in human civilization.³¹⁷

Providing IP protection for emojis provides IP owners with an unprecedented degree of control over how people talk with each other.³¹⁸ It is as troubling as saying Microsoft can own the word “windows”³¹⁹ and collect payment for, or block usage of every instance of, the word in every context. “Weaponizing” words—and their emoji equivalents—through IP protection can substantially harm free speech and communication generally. Courts and the Copyright and Trademark Offices can de-weaponize emojis by respecting emojis’ importance to how we communicate. Fortunately, many of the applicable doctrines provide discretion to appropriately limit IP protection for emojis.³²⁰

CONCLUSION

Emojis are an exciting and important addition to our communicative toolset.³²¹ They are a new way of expressing ourselves.³²² In particular, by filling in gaps of our existing communications options, emojis have the capacity to help us communicate more precisely.³²³ As Professor Vyvyan Evans said, “Emoji actually enables users to better express their emotions, and even appears to help them to become more effective digital communicators.”³²⁴

Unfortunately, the law seems destined to thwart emojis’ communicative potential. Instead of emojis improving the precision of our communications, emojis increase our misunderstandings—because intellectual property law is forcing unnecessary and unhelpful depiction variations. As one commentator said: “We’re living in a scary new world, one where we cannot trust that emoji we’re sending is truly the emoji that will be delivered.”³²⁵

Fears about the trustworthiness of emojis—which are based on legitimate concerns—will perniciously inhibit our expressive activities. If we embrace emojis as building blocks of human communication, the legal path becomes clear. We want to encourage standardization and reduce discrepancies, and that will require minimizing the effects of IP thickets on emojis.
