

## Community License Makes a Big Difference in First Responder Apps

### Body:

Andreas Wegener is a software developer versed in several programming languages and experienced with embedded software, circuit design, and microprocessor programming.

### Challenge

Andreas was developing two apps essential to firefighters. One was a .NET MAUI app that would show firefighters routes to alarm destinations while indicating where the nearest water sources would be. The other was a Blazer Server app that would track the educational achievements of firefighters and issue certificates.

He was using standard components that failed to meet the aesthetic aspirations he had for his apps. That's when he searched for something better.

### Solution

Andreas discovered the Community License by Syncfusion®, giving him access to all the components he needed to build his apps—for zero cost.

Syncfusion's ListView, Tab, and PopUp components transformed the design of his applications and provided the sophisticated look he wanted. He also found that the functionality of Syncfusion's DataGrid, right out of the box, made a huge difference and significantly reduced his development time.

Although these components came with a learning curve, they quickly led to success after implementation, and Andreas was thankful for the money he saved.

### Result

- Time saved thanks to easy integration.
- Beautiful, user-friendly UIs.
- Access to helpful documentation and support.
- All at no cost.

### Pull Quote

"Great components that drastically reduce development time; and a great support team."

—Andreas Wegener, software developer
