

From Framework to Core: Evolving SQL Server Reporting for Modern .NET

Brandon Devine is a Senior Software Developer at [Pay Tel Communications](#), a company dedicated to bringing the advantages of technology to jail staff, inmates, and family members interacting with loved ones at containment facilities.

Challenges

Brandon needed to migrate from a SQL Server Reporting component built on the .NET Framework to one based on .NET Core. Since Pay Tel had already used Syncfusion® before Brandon joined, he knew Syncfusion could be trusted for existing projects, but did Syncfusion have anything that would remedy his current dilemma?

Solution

Bold Reports by Syncfusion® was the answer. It was the upgrade from .NET Framework to .NET Core that Brandon sought.

Finding it easy to use and realizing how thorough and accessible the documentation was, Brandon was grateful he chose Bold Reports. Had he chosen otherwise, he would have faced an uphill coding-and-debugging climb.

But because Syncfusion products are ready-made and time-tested, he didn't have to face all the issues that emerge when writing everything yourself. Syncfusion had faced them for him.

Results

Now Brandon is looking at what else Syncfusion has to offer. He's interested in the chat control; the grid that only needs a data call set up since it already filters and exports to Excel on its own; and the many, many powerful editors. And should he choose to implement any of those, he knows they come with exceptional technical support.

Pull Quote

"I've never had a sprint where I didn't get an answer if I had a question."

—Brandon Devine, Senior Software Developer, Pay Tel Communications, Inc.
