

## Improved Data Table Management with Syncfusion®

Virginia Dosdorayan is the director of development at Paván Consultores, a firm that provides systems consulting, software, and mathematical optimization models to its clients. She was looking for better data tables for her team's work and found the perfect solution with Syncfusion®.

### Challenges

Virginia tried using Flutter Dart packages to create data table widgets. She tried JsonTable, DataTable, and Editable within the Flutter package to list and update information. But she wanted more options and better features for CRUD (create, read, update, delete) operations when using the tables.

### Solution

The Syncfusion Flutter suite turned out to be the answer to Virginia and her team's needs. There was a slight learning curve because of the many functionalities of the tools, but they were easily able to learn along the way. They use the DataGrid component the most for applications connecting to their MariaDB and SQL Server databases.

### Impact

Syncfusion products help Virginia's development in multiple ways. The user-friendly design makes the apps easier to use; there's a wide variety of supported features, such as sorting, filters, and calculated fields; and there are infinite options for handling tables with its numerous controllers and functions.

### Quote

"They're fantastic! They have no limits, and they also have customer support with quick and effective responses."

- Virginia Dosdorayan
