

Diversify Your GUI Controls

Introduction

Gatoware is a Texas-based software company that specializes in the development of information systems, mobile apps, 2D games, and VR software. They strive to deliver ethical products that are maintainable, scalable, and secure.

Challenges

Jorge Maldonado is the Cofounder and a Software Engineer at Gatoware. Jorge has been in the software industry for over 40 years and works with a variety of clients, so he wanted a tool to design diverse UIs for both the client-side and server-side. He tried using DevExpress, but he needed a feature-rich solution with more flexibility, so he switched to Essential Studio®.

Solution

Jorge uses Essential Studio's ASP.NET Core and JavaScript control suites to develop UIs. "Basically, I use Syncfusion controls—both directly in views and programmatically—to design user interfaces with a professional and good-looking presentation layer," he said. "I also use it to write client-side and server-side code to add functionality."

Jorge greatly appreciated the control suites' extensive features, stating that they gave him the "freedom to add any functionality to client-side and server-side code."

Essential Studio's ASP.NET Core and JavaScript control libraries are user-friendly and contain over 140 modular components. With control suites built for performance, we help businesses achieve their dream UI design—one that's both visually engaging and responsive. Jorge supports this notion. Since using Essential Studio, he has been able to deliver "highly professional final products that are functional and look great to the end user."

"I would unquestionably suggest trying Syncfusion products."

Impact

Essential Studio's ASP.NET Core and JavaScript control libraries have made a huge impact on Gatoware. According to Jorge, "the development time decreased significantly." Want to try out Essential Studio for free? Sign up for a 30-day free trial today!
