

# Easy-to-Integrate Controls Support a Global Economy

## Metrics

Stan Roy, a lead software architect at [Workside Software](#), knows that how data is displayed matters—especially in an industry that plays such a major role in the global economy. Oil and gas companies need to be ready for all kinds of challenges, so interpreting operational data quickly is a must. With Syncfusion® Essential Studio, the team at Workside Software has found a component library that supports their development needs.

## Challenge

The oil and gas sector is a demanding market that the world's economy depends on. With that in mind, Workside is developing a web platform to allow oil and gas companies to monitor their critical performance metrics in real time.

Stan looked for products to accelerate their development process so that they could provide their application to businesses that need it as soon as possible, but most tools required a lot of front-end customization work, or they offered limited support. Progress Kendo UI and Webix didn't really work the way they wanted. So, they went looking again for a high-quality component library that could integrate with their existing work.

## Solution

Stan and the team at Workside found Essential Studio at just the right moment. With flexible UI components like advanced grids, interactive charts, and dynamic dashboards, Syncfusion posed the perfect solution to their time limitations. They were able to get the quality they needed in a time frame that worked for them.

## Impact

Syncfusion components for JavaScript and React gave Stan and his fellow developers an easy-to-integrate set of tools. "We were able to quickly incorporate advanced grids, charts, and dashboards into our application," Stan said, "which significantly accelerated our development process." To keep up with the needs of a global business, Workside was able to incorporate components from the ever-expanding library of more than 1,900 Syncfusion controls—all in service of an intuitive web experience for the oil and gas industry.

“Syncfusion's tools are fantastic,” Stan added. “Not only do they provide robust, feature-rich components that fit seamlessly into our applications, but their support is truly unparalleled. The team is incredibly responsive and always goes the extra mile by supplying comprehensive, ready-to-use code samples and guidance.”
