Syncfusion React Components Help Wrangle Unruly Data

Body

Venkat Majeti is the director and CTO of Total Automation Solutions (TAS), a global automation firm that provides tech solutions to companies in various industries—from oil and gas to manufacturing.

Challenges

At TAS, Venkat works on various projects to help other businesses manage their data. When companies generate huge amounts of data, a system of organization equips them to use that information effectively instead of amassing data for no reason. Venkat and his team needed tools to help their users interact with large data sheets.

Solution

To supply his clients with an effective tool, Venkat needed a way to wrangle lots of data into meaningful, actionable information. He and his team needed UI components to display interactable data interactively, so they sought a solution that saved development time and offered polished grids and charts. When Venkat came across Syncfusion® components, he knew they'd found the perfect solution.

Results

With the React Data Grid and Charts components from Syncfusion, Venkat improved their data management app with a more streamlined user interface. The reliable components offered just the avenue they needed to perfect their UI, and now Venkat and TAS can use their newly freed-up time and effort to make their projects even better.

Pull Quote:

"Syncfusion tools saved us development time and provided a more polished, feature-rich interface."
