

HURST *The Solid Fuel People*

Hurst Firebox Series involves years of engineering and construction of the wood, coal, and solid waste fired fuel systems. This efficiency is achieved by superior utilization of the fuels radiant heat within the water cooled furnace. The Firebox is adaptable to dry wood, wet wood, coal and an array of other waste fuels. Furthermore, the large furnace allows for efficient firing of auxiliary fuels (gas, fuel oil, and waste oil).

The Hurst Venturi Scrubber uses the differential between high velocity gases and free-flowing water to create droplets which entrap contaminants, hold them in suspension and deliver them as a highly concentrated slurry. The Hurst Venturi Scrubber offers more advantages in separating and recovering liquid mist and ultra-fine particulate than other gas cleaning methods.
