McLanahan Introduces Vertical Shaft Pump For Sand Processing

Hollidaysburg, PA February 21, 2012 — McLanahan's horizontal shaft rubber lined range of pumps have been supplemented by the arrival of the vertical shaft version designed by our Agricultural Division for reliable duty in their Sand Separation Systems. Utilizing a split casing design and the same replaceable rubber wet end components as featured in the McLanahan Horizontal Shaft version, this pump is designed to handle sand sized solids in suspension. The pump is fitted with a proprietary mechanical gland seal and the four-bearing shaft is designed to reduce overhung loads that result in the early bearing failure common with vertical shaft pumps.
