Release Notes

TRIMBLE ACCUBID ANYWHERE

This document contains summary information on new features and product improvements related to the **Trimble® Accubid® Anywhere v2.28** release on March 6, 2026.

This release includes software corrections and general technical improvements aimed at enhancing user experience and increasing productivity.

Software Corrections

Resolved an issue saving changes of Field Labor on Extension for items with multiple manufacturers and labor types

We have resolved an issue where manual updates to Field Labor values in the Extension screen were not being saved after navigating away from the module or reopening a project.

This bug specifically affected items with multiple manufacturers and labor types, causing the system to occasionally reset labor edits back to their original values after switching screens or reopening a project.

Resolved an issue with Attribute Filters not correctly Filtering Takeoff

We corrected a bug where toggling attribute filters (such as Shop Labor, Insulation, Hangers, or Pipe Labels) would display items that did not match the selected criteria. Now, when a filter is turned ON, the Audit Trail will only display items specifically tagged with that attribute.

Restored Attributes Icon Spacing on Takeoff

We addressed a UI issue where attribute symbols were compressed together. The symbols are now properly spaced, restoring the clear and readable view of the takeoff audit trail.

Trimble MEP Client Services

Trimble MEP Client Services is available during regular business hours, Monday through Friday.
