UltraSearch searches files and folders on local NTFS drives and provides the results within just a few seconds.

UltraSearch does not maintain an index which is stored on your harddisk, it achieves its speed by working directly on the Master File Table (MFT) of the NTFS partitions. You can enter a file name or a pattern like *.exe and will see the results already while typing. Additional information like file size and last change date will be shown for the listed files and the Explorer context menu is available inside UltraSearch. The freeware lets you exclude folders, files or file types by providing an exclude filter. The search results can also be printed or exported as text, RTF, HTML, CSV and Excel file.

UltraSearch is available from within the context menu of your Windows Explorer. Use it to start a search with UltraSearch in the selected directory.

Use UltraSearch wherever you like with the portable ZIP version.

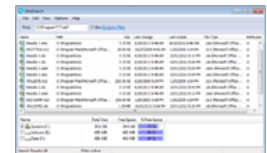

Our software **TreeSize Professional** offers a custom file search where you can search for and filter by further criteria such as file size or file date.
