## Overview

sMonitor is a network monitoring utility that allows you to verify the network connectivity of TCP/IP hosts on the Internet and LAN. The program periodically pings, or checks TCP and UDP ports on user specified other network devices. If the destination host fails to reply to a ping, connection request, or user datagram, sMonitor alerts you using audible alarms, visible notifications, e-mail and SMS (Short Message Service) customizable format, third-party applications, modem and telnet connections. Also, the program generates log files, CSV format files, creates and uploads by FTP the HTML file, which reflects a current status. By results, the program can operate remote systems (power management, reboot, alarm reporting) by modem, telnet, external applications using custom scripts. sMonitor can run as standard Windows application, a service.

**sMonitor features:**

- Runs as a standard application or a Windows service.
- Runs as a system tray application automatically on startup.
- Supports ICMP, TCP and UDP.
- Sends protocol-specific UDP requests to the ports: 67 (DHCP), 123 (NTP), 137 (NETBIOS-NS), 161 (SNMP), 389 (LDAP).
- Allows server lists to be saved and opened as user specified files.
- Alerts by audible and visible alarms.
- Allows SMTP (SSL) mail and SMS notifications when a service is down, up, or its state is changed.
- Allows custom e-mail and SMS message format to be created.
- Launches third-party applications.
- Creates an HTML status file which mirrors the main sMonitor window.
- Allows the HTML file to be customized and to be uploaded by FTP to a remote web server.
- Contains a built-in script interpreter which interacts with remote systems by modem and telnet.
- Allows custom scripts to be created and debugged.
- Generates plain text log files and CSV format files sorted by servers and services.
