User feedback

Do you know this situation? You want to enter a value into an electronic form but the form requires it in another unit than you have in mind. For you this means to open a unit converter, select the given and desired unit, enter the value and copy and paste the result. With Unit Scout it is so much easier. Only enter the value plus unit into the form's text field, add the shift operator ">>" and the desired unit. A key logger working silently in the background understands your request, deletes your input and sends the result into the text field. Your are done without toggling through your various windows, potentially forgetting the value you wanted to convert.

Features

- Unit Scout understands calculations stated in terms of unit expressions (such as "100psi*ft^2") and converts it into SI units per default or every other specified by the user.
- No user interface required. Control it from everywhere - editor, browser, spreadsheet, etc.
- Unit Scout is customizable with user defined units simply stored in tabular form.
- Conversion requests and results are logged in a diary file.
- Free of charge. No adware/spyware or similar.
- For now only working on Microsoft Windows®.

Download

Release versions of Unit Scout are available [here](#).

Development

The developer appreciates [user feedback](#) (bug reports, suggestions for improvement, desirable unit sets, etc.) and recommendation to others. If you want to encourage software maintenance and further development, your donation will be gratefully acknowledged.
