Google Chrome has matured from a lightweight and fast browsing alternative into an innovative, standard-bearing browser that people love. It's powerful enough to drive its own operating system, [Chrome OS](#). The browser that people can use today, Chrome 23, offers highly competitive features, including synchronization, autofill, and standards compliance, and maintains Google's reputation for building one of the fastest browsers available.

Chrome 23 represents a major milestone for the browser, but those expecting to see dramatic changes in major version-point updates will be disappointed. For a while now, Google has been pushing features over what it calls milestone numbers in a rapid-release cycle, which means that as soon as new features are usable in the beta version of Chrome, Google will likely push them to all users in the stable edition.

Please note that there are at least four versions of Chrome available at the moment, and this review only addresses the "stable" branch, intended for general use. Chrome beta ([Windows \(download\)](#) | [Mac \(download\)](#)), Chrome dev ([Windows \(download\)](#) | [Mac \(download\)](#)), and Chrome Canary ([Windows \(download\)](#) | [Mac \(download\)](#)) are progressively less stable versions of the browser, and aimed at developers.

There's also [Chrome for Android](#) and [Chrome for iOS](#).

Installation

Chrome's installation process is simple and straightforward. If you download the browser from Google's Web site, it will ask you if you'd like to

anonymously submit usage statistics to the company. Although you used to be able to toggle this easily, Chrome now splits up the anonymous data tracking options into multiple categories. You can toggle these from the Preferences menu (the three-line icon to the right of the location bar) under Settings, Advanced Settings, then Privacy Options. Depending on your processor, the installation process should take less than 2 minutes.

Interface

Google's Chrome interface has changed remarkably little since its surprise debut in September 2008. Tabs are still on top, the location bar (aka Omnibox) dominates the minimalist design, and the browser has few visible control buttons besides Back, Forward, a combined Stop/Reload button, and Home. Although some users may not like having the tabs on top, we find it to be aesthetically preferable because it leaves more room below for the Web site we're looking at.

The former Wrench icon for accessing settings has been replaced with the Android-styled "three-line" design. Settings open in a new tab, with many additional options available under various "advanced settings" links. It's not the best layout, and it's easy to get lost in the configuration woods as Google moves options around. Some controls, such as page zoom, are readily available. Others, such as the extension manager, are hidden away under a Tools submenu.

Chrome's extensions are fairly limited in how they can alter the browser's interface. Unlike Firefox, which gives add-on makers a lot of leeway in changing the browser's look, Chrome mandates that extensions appear only as icons to the right of the location bar. The benefit is that this maintains a uniform look to the browser, but it definitely limits how much the browser can be customized. Chrome doesn't support sidebars, either, although other Chromium-based browsers (such as [Comodo Dragon](#)) do offer the feature. There is an option in Chrome's about:flags, a series of experimental features, that lets you move the tabs to a sidebar.

Even with its limitations, the interface design has remained a contemporary exemplar of how to minimize a browser's screen footprint while keeping the browser easy to use and versatile.

Features and support

Chrome 23 offers a complete range of modern browsing conveniences. The basics are well-represented, including tabbed browsing, new window creation, and a private browsing mode that Google calls Incognito, which disables cookie tracking, history recording, extension support, and other browsing breadcrumbs.

Incognito, known in other browsers as "private mode" and to the cognoscenti as "porn mode," does not prevent your Internet service provider from peeking in on your Web traffic.

Chrome is based on WebKit, the same open-source engine that powers Apple Safari, Google's Android mobile platform, and several other desktop and mobile Web-browsing tools. However, Chrome runs on a different JavaScript engine than its WebKit cousins, and there are other changes as well.

Along with hardware-accelerated 3D CSS, there have been interesting security improvements. You can delete Flash cookies from Chrome, which makes sense given that Chrome comes with Flash built in, and there's a Safe Browsing protection against downloading malicious files. Chrome's Web app support now includes the capability to launch Web apps from the location bar. This gives keyboard jockeys a bit more power to avoid mousing around, more readily apparent in Chrome OS but nevertheless good to have in the regular old Chrome browser. You

can also change plug-ins like Flash from loading automatically to click-to-run, both a security feature and a page-load time saver.

There's Native Client, too. Also known as NaCl, it's open-source technology developed by Google that allows C and C++ code to be securely run in the browser. It basically lets software run within two protected sandboxes, which will theoretically cut down on browser-based threats dramatically. When completed, NaCl will enable Web apps to run as smoothly as programs that are hosted on your hard drive.

Besides allowing you to disable JavaScript, Chrome will automatically block Web sites that are known to promulgate phishing attacks and malware threats or be otherwise unsafe. The usefulness of this depends on Google's capability to flag Web sites as risky, though, and so it's recommended to use an add-on like the [Web of Trust extension](#) or a separate security program to block threats.

Although Chrome has a poor reputation for privacy because of its Google origins, it actually does offer a lot of privacy-tweaking settings. You can toggle and customize most of the browser's privacy and security settings. Cookies, image management, JavaScript, plug-ins, pop-ups, location information, and notifications can be adjusted from the Content Settings button. This includes toggling specific plug-ins, such as the built-in Adobe Flash plug-in or the Chrome PDF reader (which is deactivated by default). Still, that's not going to be enough for many people. If you're not comfortable using Chrome because of privacy concerns, we recommend the independent browsers Firefox or Opera.

Chrome offers malware scanning on Web pages to include downloads, and the precaching tool for loading sites in your search results early works with the Omnibox location bar.

Chrome's tabs remain one of the best things about the browser. The tabs are detachable: "tabs" and "windows" become interchangeable here. Detached tabs can be dragged and dropped into the browser, and tabs can be rearranged at any time by clicking, holding, dragging, and releasing. Not only can tabs be isolated, but each tab exists in its own task process. This means that when one tab crashes, the other tabs do not. Though memory leaks are a major concern in Chrome when you have dozens of tabs open, we found sluggish behavior and other impediments weren't noticeable until after there were more than 20 tabs open. That's not an immutable number, though, and different computers' hardware will alter browser performance.

You can sync tabs and their browsing histories to other computers and devices such as Android and iOS in Chrome 23.

Some of the basics in Chrome are handled extremely intuitively. In-page searching works smoothly. Using the Ctrl-F hot key or the menu option, searching for a word or phrase will open a text entry box on the top right of the browser. Chrome searches as you type, indicating the number of positive results and highlighting them on the page.

Account syncing is another area in which Chrome does well. Using your Gmail account,

Chrome will sync your themes, preferences, autofill entries, passwords, extensions, and bookmarks. You can toggle each of those categories, too.

Chrome has multiple user account support. This means that you can now have multiple people, or at least multiple Gmail accounts, running in Chrome simultaneously. However, it's not "people-secure," which means that although your data might be secured on Google servers, once an account is logged in to Chrome, you don't have to re-enter your account data. Anybody with access to Chrome on your computer can see your stuff.

The intuitive New Tab page allows you to create custom categories by dragging and dropping apps and bookmarks, and includes navigation arrows on the left and right edges of the page that become more visible on mouse-over.

Like Firefox, Chrome gives broad control over search engines and search customizations. Though this doesn't sound like much, not all browsers allow you to set keyword shortcuts for searching, and some even restrict which search engine you can set as your default. Chrome comes with three defaults to choose from: Google, Bing, and Yahoo.

The Chrome extension manager, bookmark manager, and download manager all open in new tabs. They allow you to search their contents and throw in some basic management options like deletion, but in general they don't feel as robust as their counterparts in competing browsers. For example, URLs in the bookmark manager are only revealed when you mouse over a bookmark, and you must click on one to get the URL to permanently appear. That's an extra click that other browsers don't require.

Two other low-profile but well-executed features in Chrome are auto-updating and translation. Chrome automatically updates when a new version comes out. This makes it harder to revert back to an older version, but it's highly unlikely that you'll want to downgrade this build of Chrome since this is the stable build and not the beta or developer's version. The second feature, automatic translation of Web pages, is available to other browsers as a Google add-on, but because it comes from Google, it's baked directly into Chrome.

Chrome is also a leader in HTML5 implementation, which is uneven because of the continuing development of HTML5 standards. This will become more important in the coming months and years, but right now it doesn't greatly affect interactions with Web sites.

Performance

Based on the open-source WebKit engine and Google's V8 JavaScript engine, Google Chrome debuted to much fanfare because of its rocketing rendering speeds. More than three years down the line, that hasn't changed, and the stable version of Chrome remains one of the fastest stable browsers available. The less stable versions, with their more recent improvements and bug fixes, are often faster.

You can see [CNET's most recent benchmark tests](#) that included Google Chrome; while that particular version of Chrome didn't do too well, the browser has seen a lot of changes since that

test and you definitely should not discount it.

Note that to effectively use hardware acceleration you must make sure that your graphics card drivers are up-to-date. Nevertheless, Chrome remains one of the fastest browsers available, and its rapid version update rate ensures that it is consistently competitive. It finally has extended hardware accelerated graphics to older Windows and Macs courtesy improvements to WebGL support and changes to Canvas2D.

Conclusion

It's hard to tell which is faster, user adoption of Chrome or its development. Certainly the two are linked, and due in no small part to Google's capability to lay claim to the "fastest browser" title, even when it may not be strictly justified. The rest of Chrome's appeal lies in its clean, minimalist look, and competitive features that justify its still-increasing market share. Chrome is a serious option for anybody who wants a browser that gets out of the way of browsing the Web.

More than just speed in Chrome:

Publisher's Description

From [Google](#):

Google Chrome is a browser that combines a minimal design with sophisticated technology to make the Web faster, safer, and easier. Use one box for everything--type in the address bar and get suggestions for both search and Web pages.

Thumbnails of your top sites let you access your favorite pages instantly with lightning speed from any new tab. Desktop shortcuts allow you to launch your favorite Web apps straight from your desktop.

What's new in this version: This is the first Stable release with support for MathML, thanks to WebKit volunteer Dave Barton. This release also contains an update to Flash (11.5.31.137) as well as improvements in speed and stability.

"The quickest browser"

December 10, 2012 | By [merindakrow](#)

Version: Google Chrome 23.0.1271.95

Pros

Very fast browser with lots of useful options.

Cons

It doesn't ask me where to save the file before download.

Summary

In general I like this browser and it's number one for me.

Reply to this review

"Chrome is great! But..."

December 8, 2012 | By [Kascaden](#)

Version: Google Chrome 23.0.1271.95

Pros

It really is Incredibly fast

Pretty darn Stable - Pages will crash now and then, but for the most part very good.
Flash Built in which is always a bonus
Add-ons

Cons

Each tab is a separate instance of Chrome.
Uses up a huge amount of memory - especially if you leave a tab open.

Summary

It's a great system - and I like the fact that it's almost crash proof - but what that means, and what general users don't understand is that everything is a separate process. This means that while being almost crash proof (as a browser as a whole) It's incredibly RAM hungry!

It uses something like half of the ram I have available in an older MacBook Pro (4GB!)

"Very Good with one MASSIVE flaw..."

December 5, 2012 | By [Jac151](#)

Version: Google Chrome 23.0.1271.95

Pros

Fast (Chrome and Safari 6 run neck and neck)
Stable
Productive
Built-In Flash

Cons

Forces AMD Discrete Graphics in 2011 MacBook Pros

Summary

Google Chrome is a very refined browser, though I prefer Safari (just personal preference), but it has one MAJOR flaw that keeps me from ever using it...
Google Chrome forces my MacBook Pro's Discrete AMD Graphics which cuts my battery life by 40%-60% and causes overall system heating. I have read many posts (on Apple Discussions, MacRumors, and Google Discussions) on the issue, although I'm surprised more people don't complain about it. On any site that uses advanced graphics, Chrome forces hardware acceleration which kills battery life. Even cnet.com activates AMD with

Chrome. . . really? I don't know if this issue affects 2012 Macs, but it is a serious issue for notebook users. Safari and FireFox do not do this.

You can check what your system is using by clicking the Apple>About This Mac>More Information. It should say Intel instead of AMD (Or Nvidia for new/pre 2011 Macs) unless you are using an intensive program like iPhoto or iMovie.

This is an unacceptable flaw that renders Chrome useless.

"Barely OK 2nd (or 3rd) browser with major Achilles Heel"

August 15, 2012 | By [JonCalgary](#)

Version: Google Chrome 21.0.1180.75

Pros

Fast. Not as fast as the close-to dead-Camino, but fast.
Automatic foreign site translation is unbeatable.

Cons

When it crashes, and it will, you will lose all the open tabs that were there previously. Other browsers will either recover automatically or ask you if you want them back. Not Chrome. This is why I hardly ever use it, and would never use it for my primary browser.

"Simply the best"

May 23, 2012 | By [PamKlinne](#)

Version: Google Chrome 19.0.1084.46

Pros

The fastest browser browser

Cons

Didn't mention any

Summary

Fast, simple, powerful.

[Reply to this review](#)

Was this review helpful? [\(0\)](#) [\(0\)](#)

"Good internet software"

May 17, 2012 | By [satyamurti](#)

Version: Google Chrome 19.0.1084.46

Pros

Fast and like Google gives all the web sites as you type the web address!!

Cons

Interferes with Yahoo mail and other software in my PC and render them not usable!

[Reply to this review](#)

Was this review helpful? [\(0\)](#) [\(0\)](#)

"Poor font rendering browser"

May 11, 2012 | By [iMercy](#)

Version: Google Chrome 18.0.1025.168

Pros

It is fast but can not say it is the fastest browser on mac. Even iCab and Sleipnir run with lightening speed on my mac, let alone Safari.

Cons

Potential collection of private data is main concern. Another concern it does not renders pages properly. Texts (fonts) looks washed out grey on many websites. Even pdf file viewed in Chrome inline pdf viewer appears with washed out fonts. It appears to me Chrome is poor quality photocopier of websites. The same webpages appears just perfect in Safari, iCab, Firefox and Sleipnir. Really can't understand, how can some people claim it to be the best browser on mac.

[Reply to this review](#)

Was this review helpful? [\(1\)](#) [\(0\)](#)

"Good second browser"

April 19, 2012 | By [jscott418](#)

Version: Google Chrome 18.0.1025.163

Pros

Quick loading, somewhat easy on memory unless you open a lot of tabs.

Cons

Possible memory issues, don't like the way it handles Favorites.

Summary

I am mostly a Safari user with Mac's. But with the whole Trojan Flashback thing. I decided to use Chrome for any Flash content playback. Not a big fan of Chrome though. Its fast but some sites still do not like it.
