## Tri-BACKUP 6

Tri-BACKUP 6: Powerful Mac Backup Software  
 Your data is priceless... Backup them!

(Mac OS X 10.4 and 10.5: Use Tri-BACKUP 5)

What is new?

F.A.Q.

Prices ▶

**Copy your disk:** Create a bootable copy of your disk updated regularly and automatically. You can restart from the copy at any time and retrieve all your data and applications in your usual environment.

*This function is also useful to change your startup disk or to duplicate an environment on multiple machines.*

**Clean Mac:** Put your Mac in good condition by using a clean copy of your startup disk. You can directly restart from the clean copy or restore your internal disk.

**Save your data:** Tri-BACKUP automatically and regularly copies your files to one or more internal or external drives, on another machine, network, FTP server, etc.

*You can multiply your backups to increase the security of your data.*

**Data recovery:** If you lose your data, backups will be much more effective than any data recovery software. Think backup with Tri-BACKUP.

**Transfers your data :** Synchronize multiple machines, share files and group documents from multiple users, across a local network or through external drives, and you can even use systems like Dropbox updated by Tri-BACKUP.

**Automate your backups :** Let your backups run automatically in the background without disturbing you or slow down the use of your machine.

*Programmed actions can be triggered at the time and frequency of your choice, or automatically executed when a disk is connected, or when you quit an application.*

**Compare and control:** With the immediate actions of Tri-BACKUP, you compare the contents of two folders and you can control exactly what needs to be copied, synchronized or deleted.

### A comprehensive backup software for Mac

Save your data is of paramount importance if you consider that your data has some significance. A computer or a disk can fail, data can be accidentally destroyed, a computer can be stolen or destroyed in a fire.

Whether personal or professional, some data is irreplaceable and will never be possible to reconstruct if lost: photos of a particular event, documents created by you, etc..

Tri-BACKUP lets you protect your data from a single copy on an external drive to a set of actions to backup on different medias that you can keep in different locations for maximum security (including backups on the internet) .

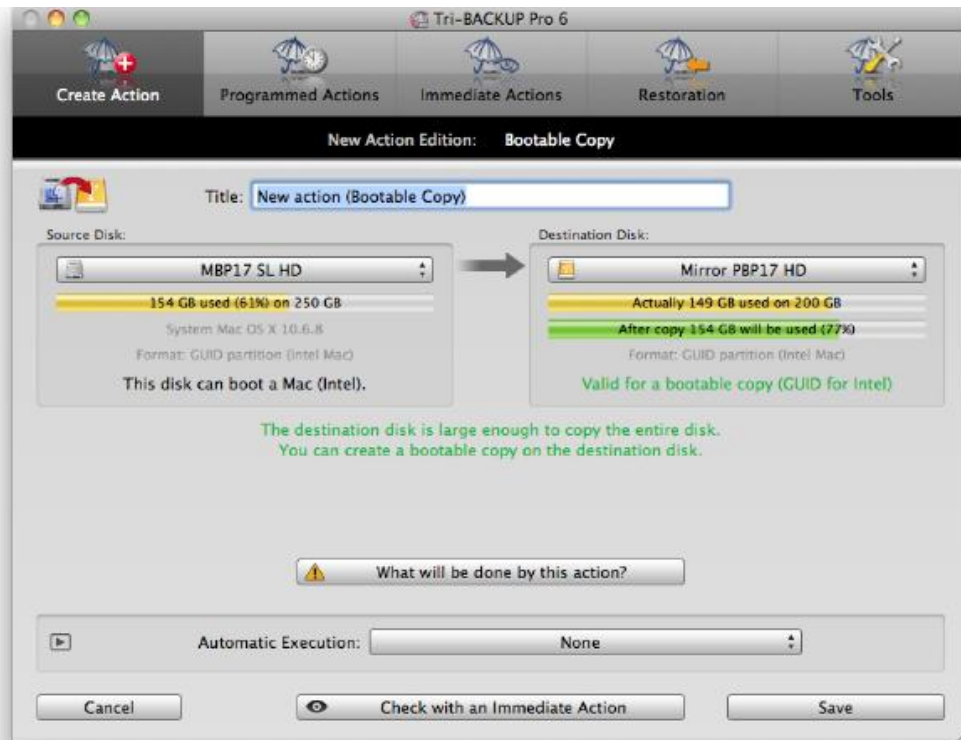

With Tri-BACKUP, you have all the tools to easily set up your backups and monitor the proper implementation. With all its many possibilities, you can create a backup system exactly right for you.

### Programmed Actions: backups that run automatically

Programmed actions are made to perform the backup job.

You can create multiple programmed actions by using the various modes available to you. You can save a file or copy an entire disk, synchronize two folders, etc.. Programmed actions retain your settings and run when you choose, or are triggered at special events (when you connect a drive, you leave an application, etc.)..

Of course, you can choose to start any of your programmed actions manually at the time of your choice.

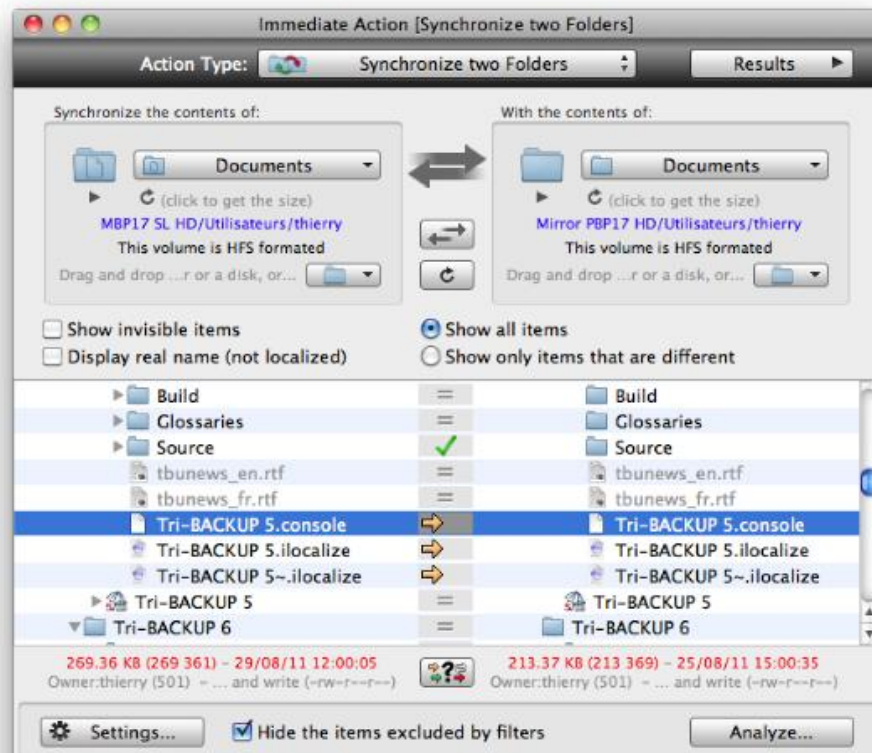

### Immediate Actions: verify and check exactly what you copy

Immediate actions let you check and compare, but also perform a specific operation.

Immediate actions to copy or sync display the contents of records or records showing the differences. You can review and analyze the differences, but also choose what to copy, delete elements, etc..

You can use the filters to exclude certain items and options to adapt the action for you.

### Intelligent copies and backups

When a backup (or copy) has already been performed, Tri-BACKUP then copies only the changed items, without wasting time copying again what does not need to be.

You can also add filters to your actions to exclude certain folders or files that you do not need, and limit the space occupied and the execution time.

### Transparent and discreet operations

Once your actions created, Tri-BACKUP is in charge of run them in the background without interfering with your work or slowing down your computer. Your data will be regularly backed up. If desired, Tri-BACKUP update an exact copy of your boot drive so that if something goes wrong, you can continue working on the copy keeping your usual environment, your settings, data and applications.

### Easy restoration of your data

When necessary, a backup tool must help you to restore your data as simply and efficiently as possible.

**From the Finder:** Tri-BACKUP backs up your data by replicating the folders hierarchy. So you can retrieve files directly from the Finder without using Tri-BACKUP.

**Looking for the most recent backup:** Tri-BACKUP tells you what action has recently saved a particular file, and where. You can easily get the latest version.

**Time Machine backups:** Tri-BACKUP also allows you to compare and retrieve data that was backed up by Time Machine, while benefiting from the filters and options of the Tri-BACKUP actions.

Tri-BACKUP can restore an entire disk as well as a particular folder.

### Pro Version

Tri-BACKUP is also available in Pro version, which adds specific functions such as backup to web server, control the actions from another machine, double checking of copy, or sending e-mail alerts (for example, to send email to an administrator when errors were detected, or to monitor the proper implementation of backups).

### Main features

- Multiple modes: copy, backup, synchronization, deletion, compression, comparison, etc..
- Multiple backup modes: Evolutive (which keeps multiple versions of each document), Mirror (identical copy), Incremental partial Disc Copy, etc..
- "Programmed Actions" running in the background, with automatic execution.
- Management of various contexts (office, home, nomad) to adapt the execution of certain actions (so that they are activated only in a particular context).
- "Immediate Actions" to check and control precisely what needs to be copied, deleted or modified.
- Ability to make encrypted backup (password protected).
- Create an unlimited number of programmed actions.
- Opening of immediate actions containing the settings stored in your programmed actions.
- Restoration with search of the location where the most recent backup of a particular folder was done.
- Restore Time Machine backups.
- History of executed actions, of copied files, etc..
- Posts information on the progress of actions.
- Automatically mount remote volumes.

*Trial version : a demo version is available for your testing. It is fully functional, but is limited in time.*

For Mac OS X 10.6 or more
