[Comparison with Time Machine](#)

[F.A.Q.](#)

## Access Time Machine Data located in any disk or Mac

From the same interface, easily access any file or folder on your Time Machine disks: your Time Machine disk, the Time Machine disks used by other Macs, and data from Time Capsule. Back-In-Time can also access the data remaining on a former Time Machine disk.

## Easily find the multiple versions and deleted items

Back-In-Time displays the number of versions available for each document, and when they were saved. You can preview and open them directly, and also have a graphical comparison of their contents. Deleted items are displayed and you can copy, preview, and open them.

## Open Multiple Browsers

Back-In-Time can open multiple browsers to display multiple Time Machine disks, folders and backup dates to compare and retrieve data easily. Copy, Recovery and Preview features are directly available.

## Drag and Drop to recover or open files

To restore a file or folder, simply drag it to its original location or to any other place on your Mac.  
 To preview a file, press the Space bar.  
 To view or open a file, drag it onto the application of your choice (the file cannot be modified when located on the Time Machine disk).

## Create Virtual Disks from Time Machine disks

Back-In-Time allows you to create virtual disks. Virtual disks are "images" of Time Machine disks containing the list of contents.

The contents of a virtual disk is displayed in the main window like a Time Machine disk. You can browse and search a virtual disk as if it were a "normal" disk.

## Combine the display of backups of multiple disks

When you change your disk, your Mac or your backup disk, Time Machine starts a brand new backup. Back-In-Time can combine multiple disks to view and handle their backups as a single backup set. You can keep browsing the backups all together to find and recover your data easily.
