## Big Brother

Big Brother gives you the ability to collect keystrokes, camera shots and audio, easily. The best monitoring software.

Until now people relied on technologies that stored all collected information inside the computer, making it difficult to obtain or manage. Big Brother works differently. Big Brother will automatically collect all the information you want and send it directly to your Gmail account. This method ensures that the

information collected is on your possession and cannot be deleted or modified once it leaves the computer. Big Brother uses SSL encryption, making it impossible to be scanned or stopped by any anti-virus software.

Big Brother provides valuable data like keystrokes, screenshots, ip addresses, recently opened files and more. It will also send you audio recordings and camera shots of everything that happens in front and around the computer, using the internal microphone and internal camera to capture everything. Big Brother is a next generation ultimate automated computer surveillance software, monitoring everything that is possible by today standards. Whether you want to protect your children from dangerous people and material on the internet, or just want to monitor your employees. Big Brother will collect any information regardless of the nature.

See what movies are being played on your computer, web sites visited, chat conversations, video conferencing, voice conversations, music, tv audio, you name it. The possibilities are endless. Big Brother runs on the background without interfering with any other software and it cannot be easily disabled. No advanced computer knowledge needed.
