While encrypting system partition it is *strongly* recommended to:

- Create bootable LiveCD with DiskCryptor BEFORE encryption;
- Backup volume header AFTER encryption.

Download

Version	Type	Size (KB)	SHA-1 checksums 	PGP Signature
1.1.846.118	installer 	978	98f4e14d9378ff50ab882ad37263465fa0cf8d31	[1]

Installation and Removal

To install the program, please download and run drcrypt_setup.exe. You can also install the program without installer by downloading .zip package, extracting the downloaded file, and running drcrypt.exe. You would be prompted to install DiskCryptor's driver and reboot your system. After the reboot you can start to use the program. The update of the program to a newer version could be performed in the same way. You can also perform install from a console by running "dcon -install" command ("dcon -update" for an update).

To completely remove the program you either need to use the uninstaller, or access menu in the program — "File → Uninstall Driver", delete all files and reboot your system. Please note, however, that if your system partition is encrypted, then it will not be possible to uninstall the driver, and you will need to decrypt the system partition, first. To remove the program from a console, please run "dcon -remove" command.
