Panic Button WST-131

Wrist panic enables user-initiated notification alerts in emergency situations.

Direct Line to Help: The wrist panic button provides the safety and security monitoring industry with a single device solution that addresses each application where an emergency notification trigger is required. Application scenarios include commercial retail/C-Store/banking hold-up, home safety panic, and home care emergency notification situations for individuals with special needs, like falling or nurse call. The solution provides application adaptability with both wearable and surface mounting options. Wearable options provide both functionality for commercial applications (belt clip), and stylish choices for the critically ambitious wearer (wrist and pendent). The solution provides surface mounting brackets for locating the device strategically (hold-up).
