GB1059D IP Network Fault Management Questionnaire Evidence

China Mobile Group Guangdong Co., Ltd.

2025.10

Proportion of tickets for each fault sub-scenario in Guangdong Mobile's IP/SPN network

Option	Fault Category	Sub-scenarios	Ticket Ratio
The IP/SPN network of Guangdong Mobile	Physical Port Failure	Sub-scenario-4: Port Failure	59.20%
	Device Offline Failure	Sub-scenario-2: Device Offline	20.78%
	Board Failure	Sub-scenario-1: Hardware Failure	1.72%
	Optical Power Abnormal	Sub-scenario-3: Optical Module Failure or Optical Power Abnormal	9.65%
	The Bit Error Rate Failure	Sub-scenario-5: High Error Rate	1.57%
	Static L3VPN Service Failure	Sub-scenario-8: VPN Interruption	1.14%
	Logical Port Failure	Sub-scenario-4: Port Failure	1.03%
	Tunnel APS Protection Failure	Sub-scenario-7: VPN Degradation	0.26%
	Optical Module Failure	Sub-scenario-3: Optical Module Failure or Optical Power Abnormal	0.08%
	Fan Failure/Abnormal Temperature	Sub-scenario-1: Hardware Failure	0.02%

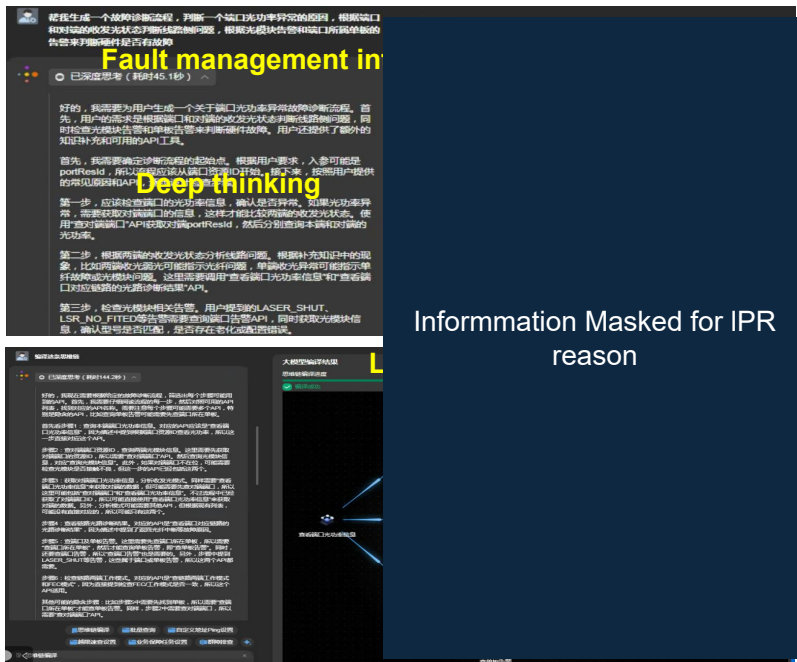

The total number of tickets for these fault sub-scenarios accounts for over 90%.

Fault management target formulation

Service capability	Weight	Question	√ Option A	Option B	Option C	Option D
Fault management target formulation	10%	Does the system support automatic generation of fault management targets? Note: 1) Intent could be fault management requirements such as MTTR (mean time to repair), troubleshooting priority (e.g., emergency restoration in highest priority), customized troubleshooting preference based on fault impact scope and severity, etc. 2) Fault management target include alarm severity, alarm threshold, alarm aggregation rules, fault notification rules, etc	The system supports the input of fault management intent by simplified human-system interaction (e.g., nature language user interface provided by system), system automatically translates the intent into fault management targets.	The system supports manual configuration of fault management targets with custom rule-based templates . Manually adjustment and confirmation is needed.	The system generates fault management targets based on predefined template. Manually confirmation is needed.	Manually set fault management targets based on expertise (such as setting alarm severity and classification).

Example evidence for option A:

1、The system interprets natural language descriptions of fault management intent, auto-generating a system-executable fault diagnosis thought chain (CoT).

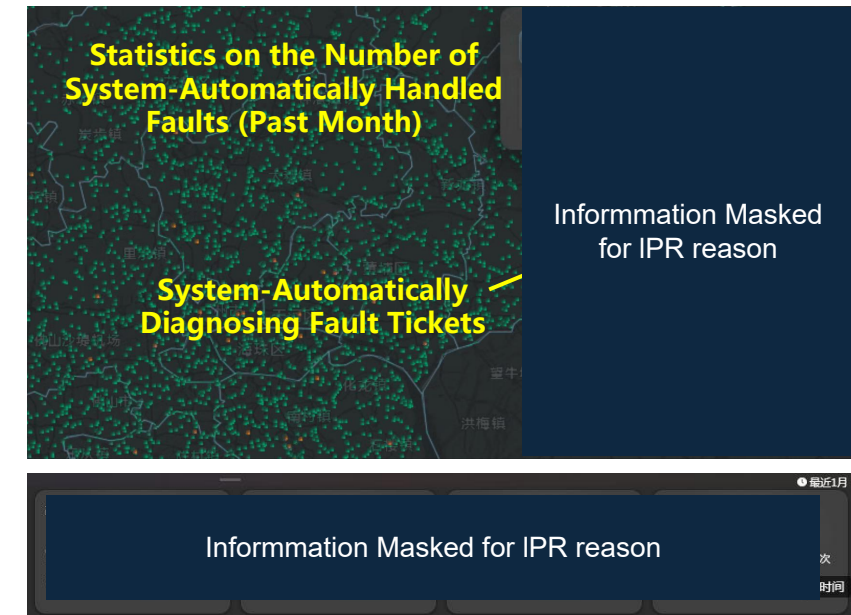

Information Masked for IPR reason

2、The system supports fault management and provides diagnostic CoT for various types of faults. The supported fault CoT includes Port Failure, Hardware Failure, Optical Module Failure, Optical Power Abnormal, Bit Error, Device Offline, VPN Degradation/Interruption, 1588 Clock, DCN, Temperature etc.

名称	描述
1588时钟异常诊断 内置	该流程用于诊断基站1588时间失步故障，包括检查接入网元告警...
区域网元脱管边界端口故障诊断 内置	用于定位单个网元端口的故障，适用于指定网元和端口出现故障...
光功率异常故障诊断 内置	该流程用于诊断指定网元特定端口的光功率异常故障，包括检测...
DCN故障诊断 内置	用于定位和解决网元DCN出现的故障、异常或中断问题。
基站或专线业务质量诊断 内置	适用于单个基站或专线出现质量的情况，包括业务质量、性能劣...
链路性能受限 内置	适用于网络设备出现各类告警情况，包括网元离线、单板故障、...
温度类故障诊断 内置	用于诊断网元的温度类告警的故障原因，对网元和网元下的单板...
隧道故障诊断 内置	用于定位和解决隧道 (Tunnel) 出现的故障、异常或中断问题。
光模块异常故障诊断 内置	本流程用于诊断指定网元和端口的光模块相关故障，包括但不限于...
端口故障诊断 内置	用于定位单个网元端口的故障，适用于指定网元和端口出现故障...
网元脱管故障诊断 内置	用于定位单个网元的脱管或离线故障，适用于指定网元出现离线...
基站或业务网络不通诊断 内置	适用于新开通或上电后的单个基站出现不通的情况，包括业务中...
环网保护故障诊断 内置	适用于环网网络拓扑中出现通信中断、业务异常、设备掉线或网...
单板故障诊断 内置	适用于网络设备中单板出现异常的情况，包括但不限于单板无法...
基站群障故障诊断 内置	适用于多个基站同时出现通信中断、业务异常、掉线、掉站或不...
区域网元脱管故障诊断 内置	用于定位多个同一脱管区域的网元的故障，适用于多个网元出现...
告警诊断 内置	适用于网络设备出现各类告警情况，包括网元离线、单板故障、...
风扇板异常诊断 内置	用于诊断风扇板是否存在异常，对指定单板进行状态检查和温度...

3、When a fault occurs, the system automatically takes over the fault ticket, understands the intent of the ticket, automatically loads the corresponding fault diagnosis CoT, performs fault demarcation and localization, and generates a repair solution, thereby realizing the automated disposal of the fault process.

System Automatic Diagnosis-Related Statistics (Past Month): Fault Ticket Automatic Diagnosis Rate, Average Diagnosis Duration, etc.

Data Collection

Service capability	Weight	Question	√ Option A	Option B	Option C	Option D
Data Collection	10%	Does the system support automatic collection of fault-related indicators, including alarms, logs, performance, and OAM data etc.? Note: 1) fault should include but not limit to device offline, physical port down, optical module failure, etc. 2) All types of faults mentioned in 1) and fault-related indicators mentioned in options should be covered when choosing a related option	The system automatically collects fault-related indicators including alarms, logs, performance, and OAM data, detecting service and network status in minutes .	The system automatically collects fault-related indicators including alarms, logs, performance, detecting service and network status within 15 minutes or 24 hours .	The system automatically collects alarms and logs .	

Example evidence for option A:

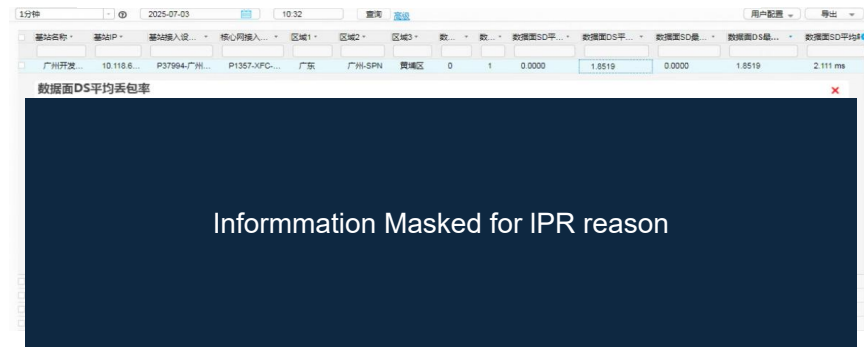

Real-time Fault & Performance Alarm Management

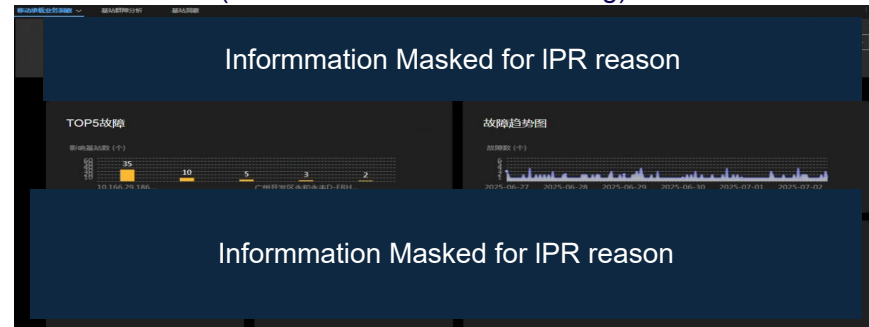

Log Management

Minute-level Performance (Traffic, Packet Loss, Delay, Jitter, etc.)

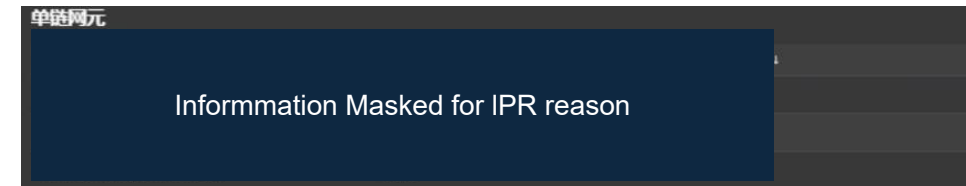

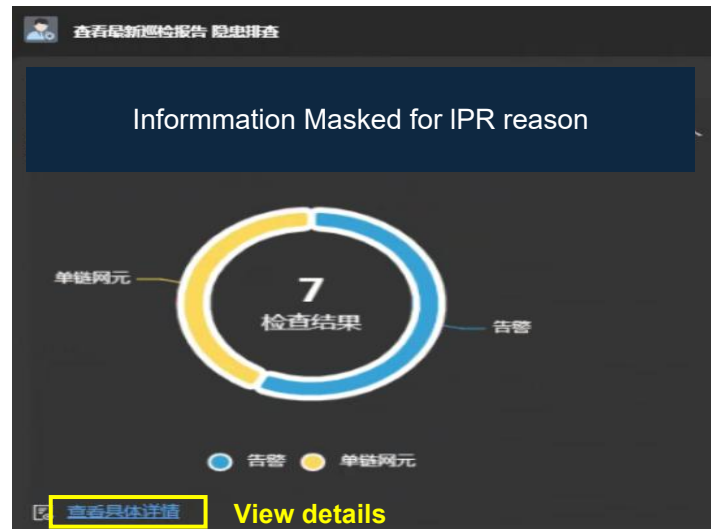

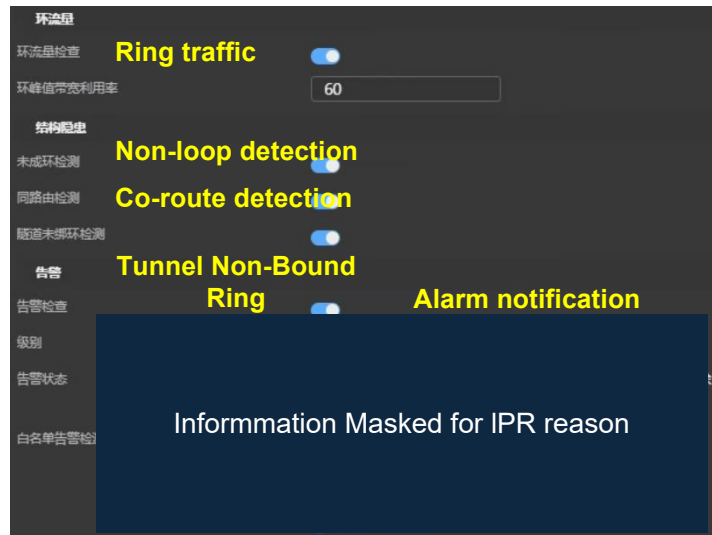

Service Fault Dashboard (Base station service monitoring)

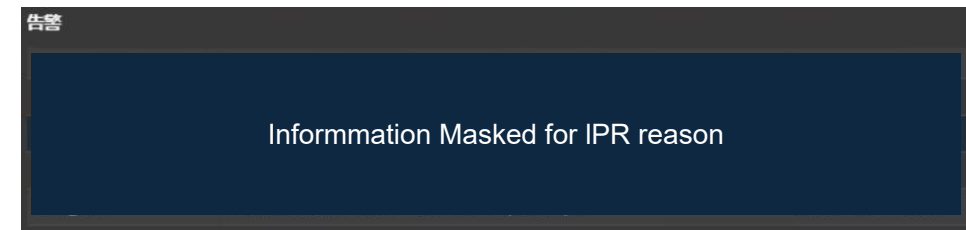

Risk identification

Service capability	Weight	Question	√ Option A	Option B	Option C	Option D
Risk identification	10%	Does the system support automatic identification of risks? Note: 1) existing risks can be reported in alarm/event , including but not limited to network element and link anomalies , . For example, board temperature, ip configuration conflict, optical module with weak optical power, etc. 2) potential risks can't be reported directly in alarm/event, including but not limited to network element resource and capacity anomalies, network configuration anomalies, and routing anomalies. For example, abnormal memory usage of device, incorrect static route configuration and incorrect BGP configuration, abnormal BGP route number, etc.	The system supports automatic identification of existing risks and prediction of potential risks .	The system supports automatic identification of existing risks .	The system identifies risks based on manually pre-defined rules .	Manually identify risks based on expertise.

Example evidence for option A:

Risk: Single-Linked NE

Risk: Critical Alarm List

System supports network risk detection, such as Non-loop detection, Co-route detection, Tunnel Non-Bound Ring detection, Ring traffic threshold-crossing detection, Alarm detection.

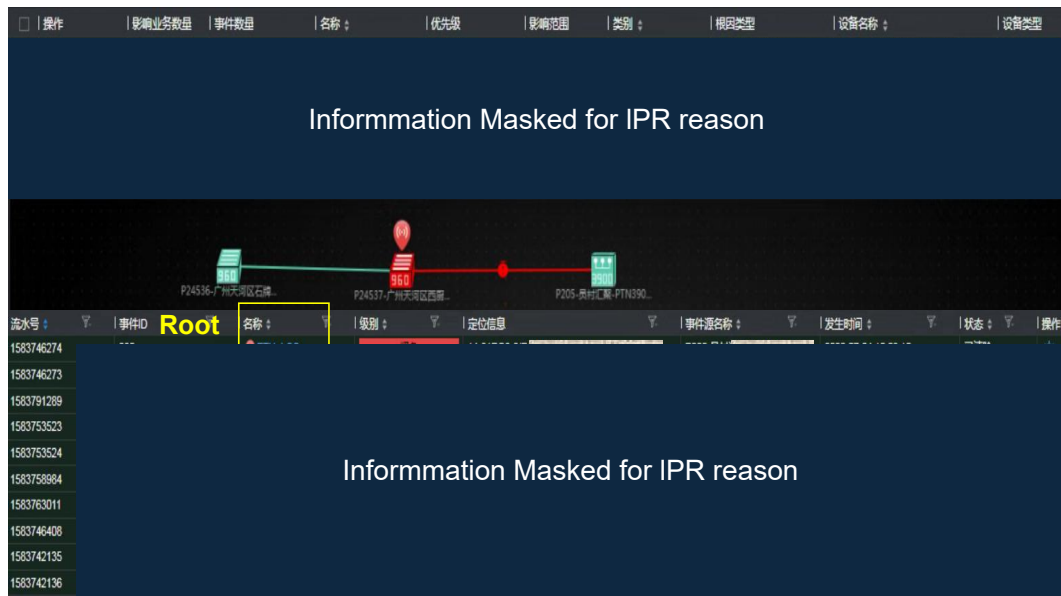

Query the network risk check results using natural languages. A risk check result diagram is generated, showing the risk type and quantity.

Click View details to view the specific location of the risks. Click Export to generate a check result statistics table in XLS format.

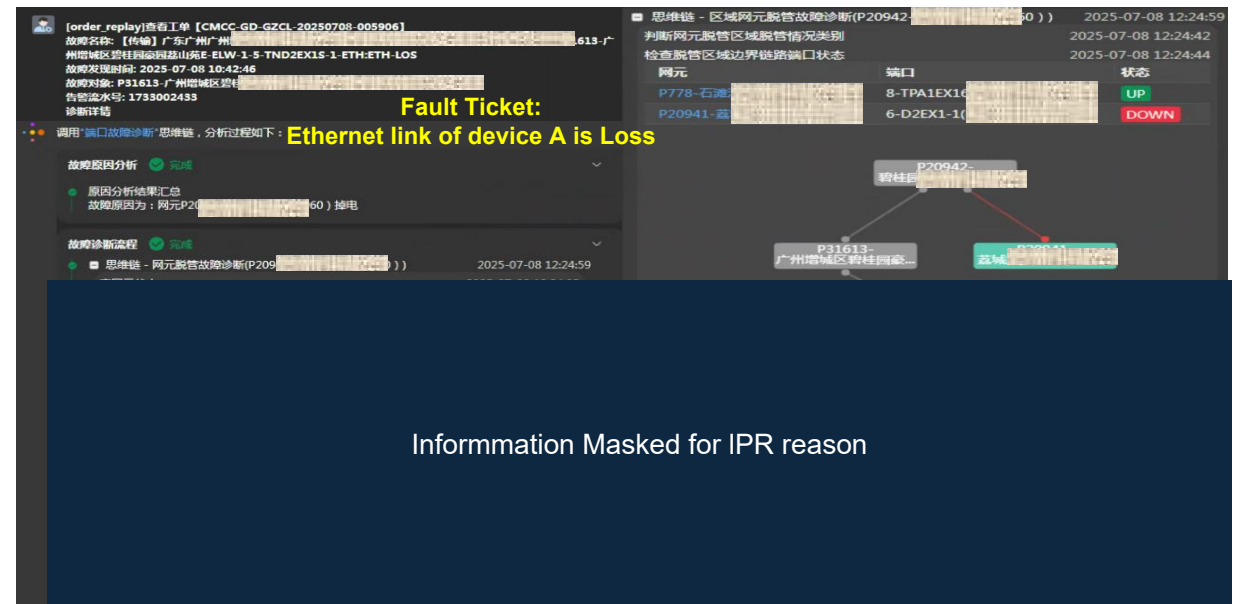

Fault identification & Impact analysis

Service capability	Weight	Question	Option A	Option B	Option C	Option D
Fault identification and impact analysis	10%	Does the system support automatic and intelligent identification of faults? Note: 1) fault should include but not limit to device offline, physical port down, optical module failure, etc. 2) Custom rules include but not limited to scenario specific rules made based on data analysis on alarms, logs, performance and OAM data, etc.	The system supports automatic fault identification by intelligent aggregating of multiple data source (alarms, logs, performance data, OAM data, etc.). System provides the impacted services with severity.	The system support automatic fault identification based on custom rules , results need manually confirmation.	The system supports automatic fault identification based on predefined rules, results need manually confirmation.	Manually identify faults based on expertise.

Example evidence for option A:

Alarm automatically aggregate to identify root & correlated alarms.

After receiving the fault ticket, the system automatically diagnoses the root cause of the fault and the affected services.

Demarcation of faults and risks -1

Service capability	Weight	Question	√ Option A	Option B	Option C	Option D
Demarcation of faults and risks	20%	Does the system support automatic demarcation of faults and risks? Note: 1) Examples of demarcation involve pinpointing the exact roles of malfunctioning routers, like identifying whether they are access routers, aggregation routers, or Autonomous System Boundary Router (ASBR). 2) Custom rules include but not limited to scenario specific rules made based on data analysis on alarms, logs, performance and OAM data, etc..	The system automatically demarcates the faults and risks without manual intervention .	The system demarcates the faults and risks based on custom rules , results need manually confirmation .	The system demarcates the faults and risks based on predefined rules , results need manually confirmation .	Manually demarcates the fault and risks based on data such as operation logs and captured packets.

Example evidence for option A:

After receiving the fault ticket, the system automatically demarcates and locates faults.

Sub-scenario-1: Hardware Failure

Fault Ticket: The board is offline or not registered.

Root cause: The board is installed incorrectly

Information Masked for IPR reason

Sub-scenario-2: Device Offline

Fault Ticket: Ethernet link of Device A is Loss

Root cause: Device B is powered off

Information Masked for IPR reason

Sub-scenario-3: Optical Module Failure or Optical Power Abnormal

Fault Ticket: Optical Power Abnormal

Root cause: The optical module does not match

Optical Power Check

Information Masked for IPR reason

Demarcation of faults and risks -2

Service capability	Weight	Question	√ Option A	Option B	Option C	Option D
Demarcation of faults and risks	20%	Does the system support automatic demarcation of faults and risks? Note: 1) Examples of demarcation involve pinpointing the exact roles of malfunctioning routers, like identifying whether they are access routers, aggregation routers, or Autonomous System Boundary Router (ASBR). 2) Custom rules include but not limited to scenario specific rules made based on data analysis on alarms, logs, performance and OAM data, etc..	The system automatically demarcates the faults and risks without manual intervention.	The system demarcates the faults and risks based on custom rules , results need manually confirmation.	The system demarcates the faults and risks based on predefined rules , results need manually confirmation.	Manually demarcates the fault and risks based on data such as operation logs and captured packets.

Example evidence for option A:

After receiving the fault ticket, the system automatically demarcates and locates faults.

Sub-scenario-4: Port Failure

Fault Ticket: Port failure
Root cause: Device powered off caused the border ports failure

Peer Device and Port Status Check
Demarcation result: the offline device is identified

Fault location result: The device's power-off caused the port fault

Demarcation of faults and risks -3

Service capability	Weight	Question	Option A	Option B	Option C	Option D
Demarcation of faults and risks	20%	Does the system support automatic demarcation of faults and risks? Note: 1) Examples of demarcation involve pinpointing the exact roles of malfunctioning routers, like identifying whether they are access routers, aggregation routers, or Autonomous System Boundary Router (ASBR). 2) Custom rules include but not limited to scenario specific rules made based on data analysis on alarms, logs, performance and OAM data, etc..	The system automatically demarcates the faults and risks without manual intervention .	The system demarcates the faults and risks based on custom rules , results need manually confirmation .	The system demarcates the faults and risks based on predefined rules , results need manually confirmation .	Manually demarcates the fault and risks based on data such as operation logs and captured packets.

Example evidence for option A: After receiving the fault ticket, the system automatically demarcates and locates faults.

Note: For sub-scenario 6 (Protocol State Abnormal), no example evidence is provided as there are no corresponding fault tickets in the actual network.

Sub-scenario-5: High Error Rate / Port Bit Error

Sub-scenario-7: VPN / Tunnel Degradation

Sub-scenario-8: VPN / Tunnel Interruption

Fault Ticket: Bit Error

故障名称: (传输) 广东广州番禺区都那新街四巷1号
故障发现时间: 2025-07-07 14:52:10

网元P44881-广州番禺区都那新街... (PORT-1) 收光弱, 发光正常; 网元P19327-广州番禺区都那新街... (PORT-1) 收光正常, 发光正常, 原因是光纤整体损耗大 (老化/弯曲/连接端污染)、光模块未插紧。

Root cause: The optical fiber fault caused port bit errors

Fault ticket: Tunnel interrupted

Root cause: Port Connector Interrupted

Demarcation result: the fault tunnel path is identified

Fault ticket: Tunnel interrupted

Root cause: Port Connector Interrupted

Demarcation result: the fault tunnel path is identified

Locating of faults and risks -1

Service capability	Weight	Question	√ Option A	Option B	Option C	Option D
Locating of faults and risks	15%	Does the system support automatic root cause analysis for network faults and risks? Note: 1) Examples of detailed causes of identified faults, including the smallest replaceable unit, software modules, and ports. 2) Custom rules include but not limited to scenario specific rules made based on data analysis on alarms, logs, performance and OAM data, etc	The system automatically analyzes root cause without manual intervention .	The system provides one or more suspected causes based on custom rules , manually analyze and confirm the root cause.	The system provides cause analysis based on predefined rules , manually analyze and confirm the root cause.	Manually analyze root cause based on expertise.

Example evidence for option A:

After receiving the fault ticket, the system automatically demarcates and locates faults.

Sub-scenario-1: Hardware Failure

Generation and evaluation of solutions -1

Service capability	Weight	Question	√ Option A	Option B	Option C	Option D
Generation and evaluation of solutions	15%	Does the system support automatic generation and evaluation of emergency restoration and repair solution? Note: 1) Emergency restoration solution may be compute alternative paths based on service SLA requirement. 2) Repair solution may be repair power supply.	The system automatically generates emergency restoration and repair solutions. The system automatically make decision on the alternative solutions based on evaluation through simulation .	The system automatically generates emergency restoration and repair solutions. Manually make decision on the alternative solutions.	The system gives emergency restoration suggestions. Manually formulate solutions and make decision.	Manually analyze and evaluate emergency restoration solutions based on system-collected service data.

Example evidence for option A: After receiving the fault ticket, the system automatically generates emergency restoration and repair solutions.

The system automatically generates an emergency repair solution based on information such as the fault cause and location. The repair solution includes capabilities for two phases:

Phase 1: For faults that the system can automatically repair, it calculates alternative paths to restore services (refer to Fault Sub-scenario 8: VPN/Tunnel Interruption).

Phase 2: For faults requiring on-site manual handling, the system provides a detailed repair plan to guide maintenance personnel in conducting accurate on-site operations, thereby improving on-site work efficiency.

Execution and verification-1

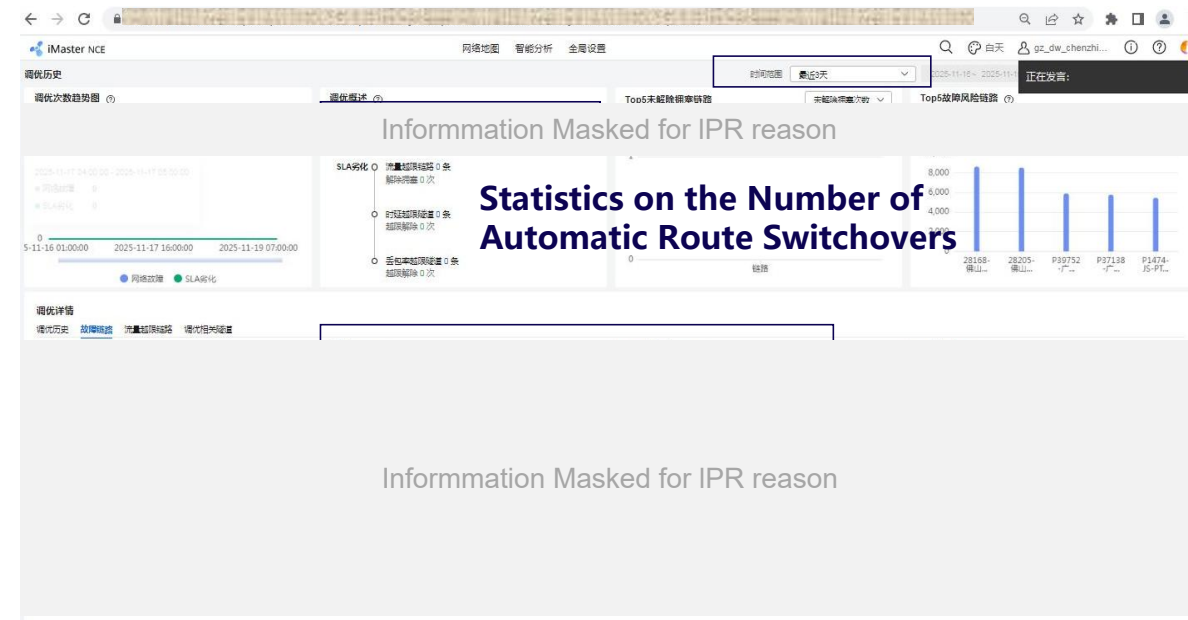

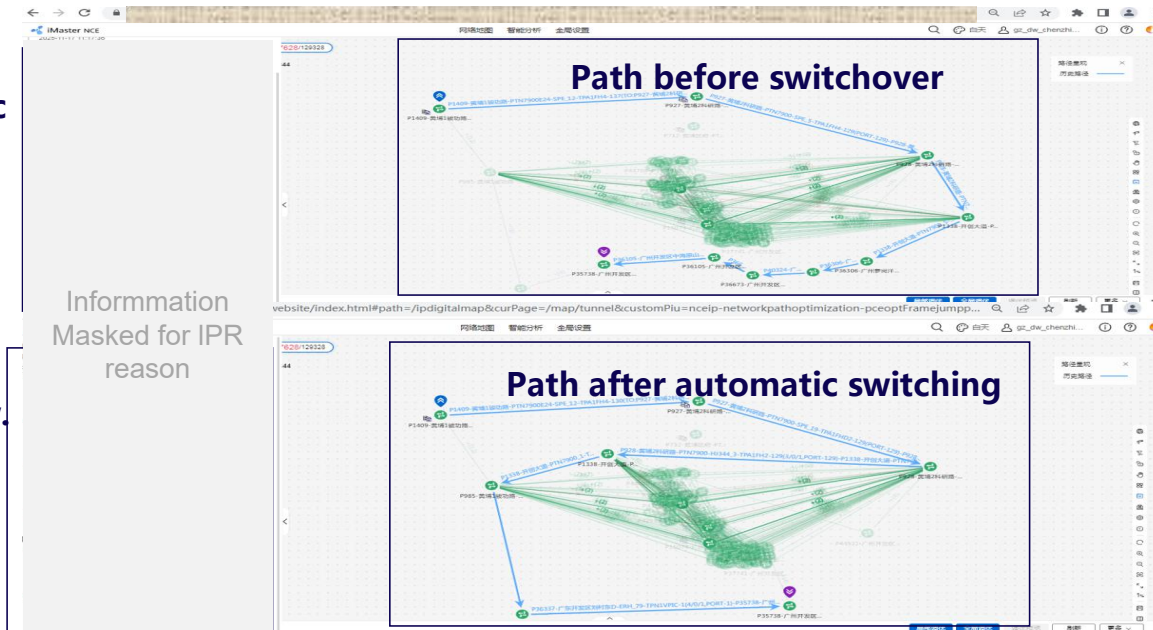

Service capability	Weight	Question	√ Option A	Option B	Option C	Option D
Execution and verification	10%	Does the system support automatic execution and verification? Does the system support assistance for on-site engineers?	1) The system supports automatic execution and verification of emergency restoration and repair solution. (Automatic repair excludes the faults that on-site handling is necessary, such as power supply failure, board fault, fiber cut). 2) The system support intelligent on-site instruction and efficient information query based on simplified human-system interaction.	1)The system supports automatic execution of emergency restoration and repair solution. Manual verification is needed. 2)The on-site handling are assisted by tool.	The system support automatic execution of emergency restoration. Manually execute repair solution. Manually verify by analyzing system data (e.g., alarms)	

Example evidence for option A:

Scenario 1: For faults that can be automatically repaired by the system, the system automatically executes emergency plans to restore services and achieve service recovery.
Scenario 2: For faults requiring on-site manual intervention, frontline maintenance personnel can use the mobile O&M app to perform simplified human-system interaction during site visits. They can intelligently query fault work order diagnosis information, alarm status, optical power indicators, and other data on-site, enabling self-service data access.

Scenario 1, The system automatically executes the emergency recovery plan to restore services.

Automatic route switching history during failures, records traceable for review.

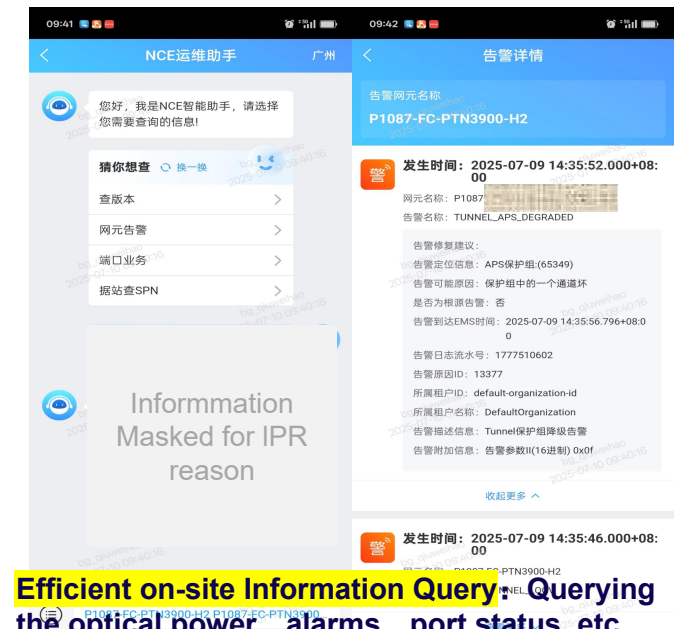

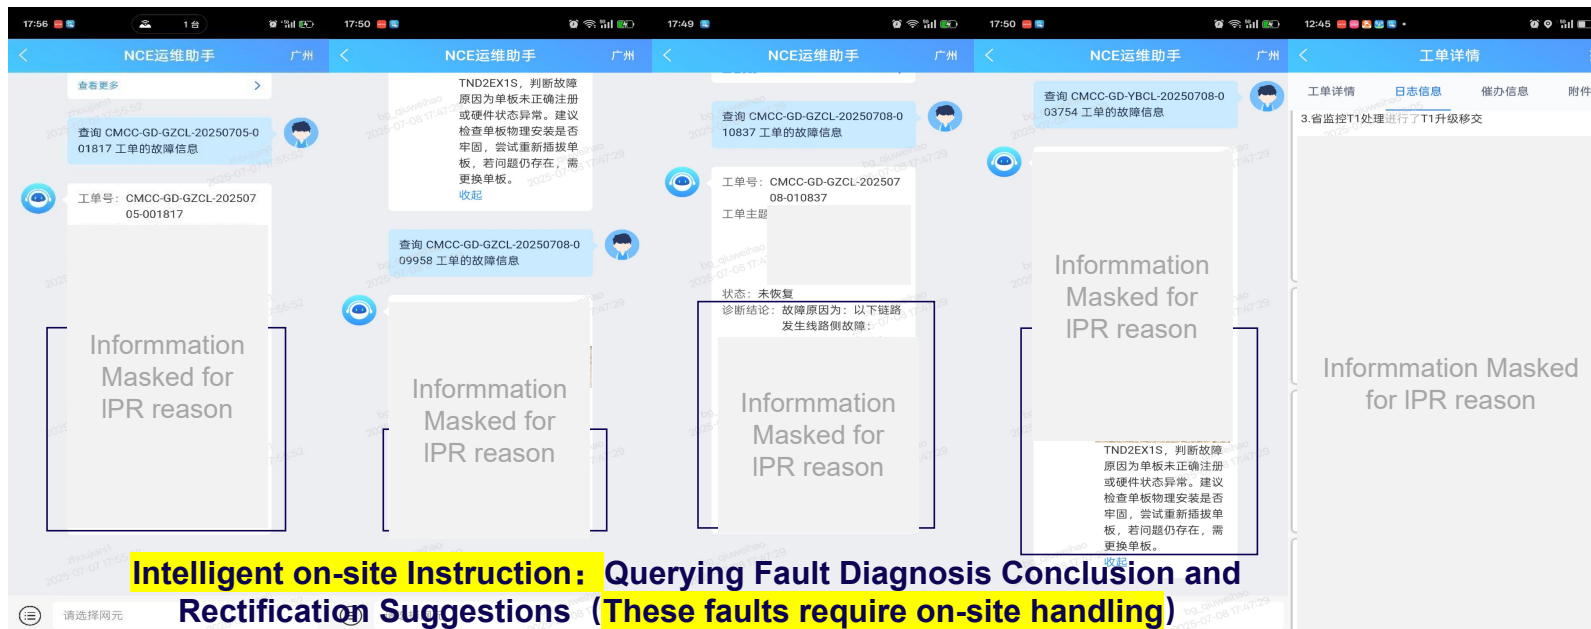

Execution and verification-2

Service capability	Weight	Question	✓ Option A	Option B	Option C	Option D
Execution and verification	10%	Does the system support automatic execution and verification? Does the system support assistance for on-site engineers?	1) The system supports automatic execution and verification of emergency restoration and repair solution. (Automatic repair excludes the faults that on-site handling is necessary, such as power supply failure, board fault, fiber cut). 2) The system support intelligent on-site instruction and efficient information query based on simplified human-system interaction.	1)The system supports automatic execution of emergency restoration and repair solution. Manual verification is needed. 2)The on-site handling are assisted by tool.	The system support automatic execution of emergency restoration. Manually execute repair solution.
