

TM Forum Open APIs Conformance Certification

Company Name:

ENTELE

Product Name and Release Version:

Open eXperience Layer 2026

TM Forum Open API Name and Release Version:

TMF679 – Product Offering Qualification

Management v.5.0.0

Date: 23/03/2026

1. What Product or Solution does your API support?

Entel's API Platform has encapsulated and instantiated the Product Offering Qualification Management API TMF679 to provide a standardized mechanism for document management such as creation, update, retrieval, deletion and notification of events, where a document can be an individual or an organization that has any kind of relationship with the enterprise.

Communication Service Providers (CSPs) are constantly working to make their platforms more connected and adaptable. But every time a new feature is introduced, it often means building a new API or making changes to multiple systems. This slows down the launch process, making it harder to meet market demand and missing out on potential revenue.

To move faster and deliver better, more tailored experiences, CSPs need to adopt standard APIs like OpenAPI-TMF. These standards help everyone, from CSPs to vendors, speak the same technical language. That means simpler integration, quicker project delivery, and a smoother path to innovation.

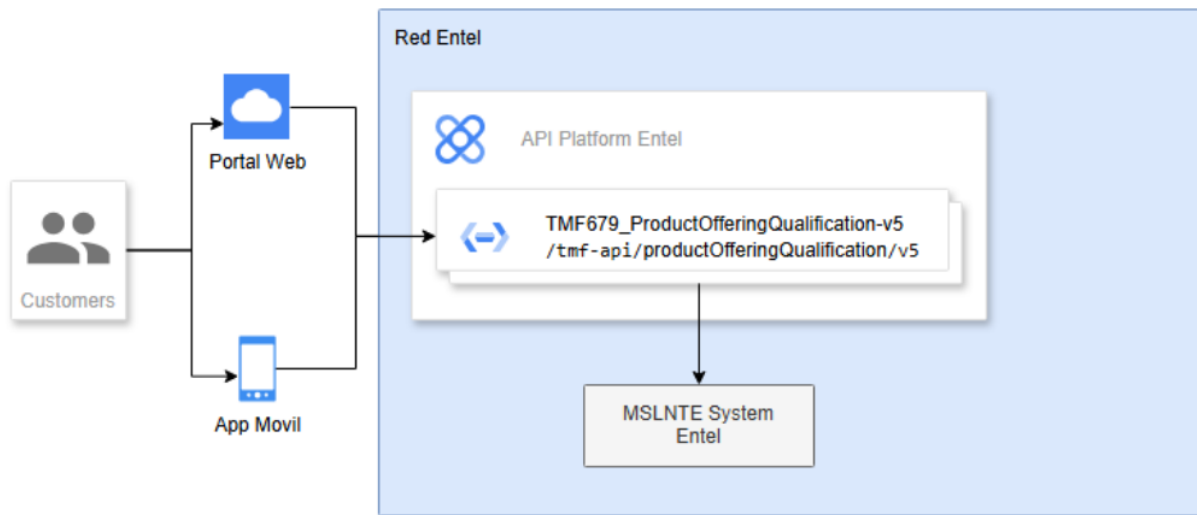

2. Overview of Certified API

The Product Offering Qualification Management API provides a standardized interface for handling party-related data, compliant with TMF679 specification. It supports the full lifecycle of document entities, including individuals and organizations, by enabling creation, update, retrieval, deletion, and event notification. This API is essential for registering parties before assigning roles, such as enabling third-document payers in billing scenarios and supports operations based on flexible query criteria.

#	Resource	API Overview	Operations Supported

1	Check Product Offering Qualification	This operation is designed for an immediate eligibility check of a product offering (for example: availability, customer eligibility, location) without creating a long-lived record. It's ideal when you need a quick "yes/no" type response in the front-end or a self-service scenario. Because no persistent qualifying object is stored (or only temporarily), the focus is on speed and stateless validation rather than tracking over time.	POST, GET
2	Query Product Offering Qualification	This resource supports the full lifecycle of a qualification request: submitting a qualification, storing a persistent record (POQ), tracking status, retrieving, and filtering results. It's used when qualification involves multiple items, manual checks, or must be referenced by other systems. Clients can create a qualification (via POST), fetch its status (via GET /{id}), or search/filter across qualifications (via GET). The result provides richer detail (such as alternate offerings, completion dates or states) compared to a simple real-time check.	POST, GET
