*Release: 1.0*

## ***TM Forum Open API Name and Release Version:***

*TMF666 - Account Management v5.0.0*

***Date: 09/06/2026***

# 1. What Product or Solution does your API support?

NGBSS is a TM Forum-aligned Business Support System (BSS) platform designed for Communication Service Providers (CSPs), MVNOs, and Digital Service Providers. The platform supports customer lifecycle management, account management, product and service management, billing, revenue management, and digital channel integration.

The certified implementation includes the TM Forum Open APIs for Account Management (TMF666 Account Management API). Together, these APIs provide a standards-based foundation for managing parties, customers, and customer accounts across the customer lifecycle.

The Account Management API supports management of customer-related accounts, including party accounts, billing accounts, settlement accounts, and financial accounts, along with account hierarchies and relationships.

These APIs are used by customer onboarding applications, CRM systems, self-service channels, billing platforms, and partner integrations to provide a consistent and interoperable customer domain based on TM Forum Open API standards.

## 2. Overview of Certified API

The certified implementation provides TM Forum-compliant APIs for Account Management (TMF666). These APIs form the customer domain of the NGBSS platform and enable standardized management of parties, customers, and accounts throughout their lifecycle.

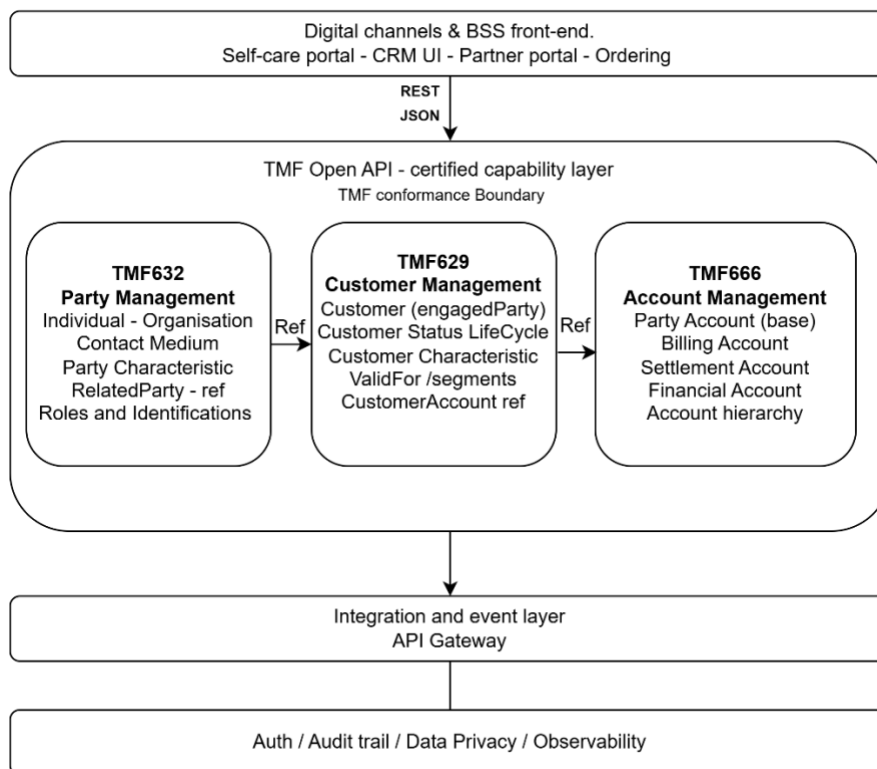

TMF666 manages party, billing, settlement, and financial accounts, including account hierarchies and relationships. Together, these APIs support customer onboarding, customer management, billing integration, and digital channel interactions while enabling interoperability with external OSS/BSS systems through TM Forum Open API standards.

The TMF666 Account Management API provides a standardized mechanism for managing billing, settlement, and financial accounts within our Next Generation BSS platform. It supports the complete account lifecycle for consumer, enterprise, partner, and wholesale business models by managing account structures, billing preferences, payment arrangements, credit profiles, and financial relationships. The API acts as the financial foundation of the BSS architecture and integrates with Party, Customer, Agreement, Product Ordering, Billing, Payment, and ERP domains to enable digital service delivery, partner settlements, and efficient revenue management while ensuring interoperability through TM Forum Open API standards.

### 3. Architectural View

The NGBSS platform follows a service-oriented, API driven and TM Forum Open API-based architecture. The certified APIs—TMF666 Account Management API—form the core Customer Domain within the platform and provide standardized interfaces for customer, party, and account management.

External systems such as CRM applications, self-service portals, mobile applications, partner systems, order management systems, and billing platforms access customer-domain information through the TM Forum Open APIs exposed by the API Gateway. The APIs are implemented as independent services within the NGBSS platform and interact with shared business services and the customer master data repository.

The Account Management API manages Party Accounts, Billing Accounts, Settlement Accounts, and Financial Accounts and maintains relationships between customers and accounts.

Together, these APIs provide a consistent customer information model and enable interoperability between internal BSS components and external systems through TM Forum-compliant REST interfaces.

The TMF666 Account Management API provides the financial account management layer of our Next Generation BSS architecture, enabling the standardized

management of billing, settlement, and financial accounts across B2C, B2B, and partner business models. The API maintains account-specific financial information and integrates with Party Management (TMF632), Customer Management (TMF629), Billing, Payment, Product Ordering, and ERP systems to support digital onboarding, billing operations, partner settlements, and revenue management. Its TM Forum compliant implementation ensures interoperability, reusable business capabilities, and scalable account management across the BSS ecosystem.
