***TM Forum Open API Name and Release Version:***

*TMF771 – Resource Usage Management v.5.0.0*

***Date: 09/07/2026***

## **1. What Product or Solution does your API support?**

Entel's API Platform has encapsulated and instantiated the Resource Usage Management API TMF771 to provide a standardized mechanism for resource usage management such as creation, update, retrieval, deletion and notification of events, where a Resource Usage represents an occurrence of usage on a resource that can be used to generate a billing charge.

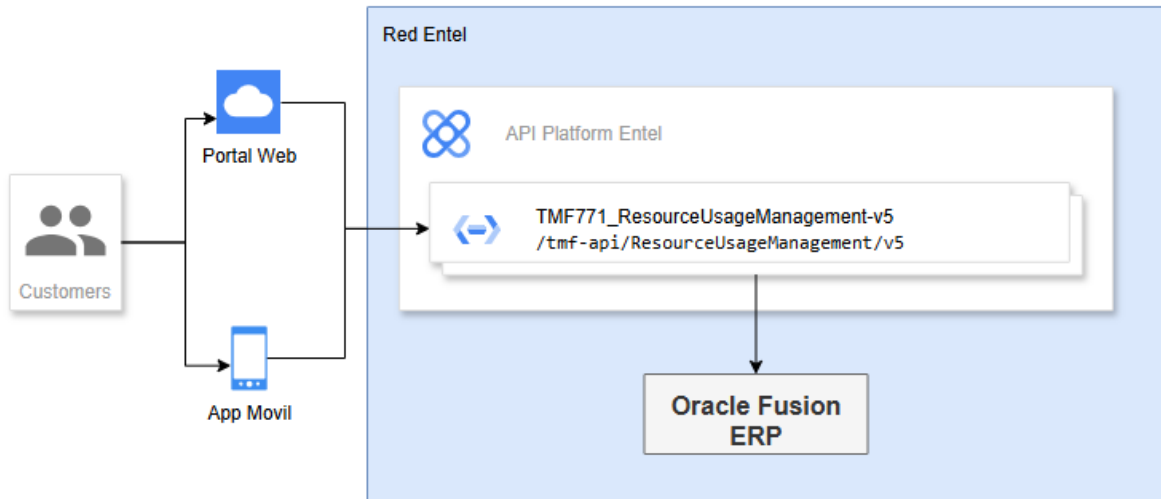

Communication Service Providers (CSPs) are constantly working to make their platforms more connected and adaptable. But every time a new feature is introduced, it often means building a new API or making changes to multiple systems. This slows down the launch process, making it harder to meet market demand and missing out on potential revenue.

To move faster and deliver better, more tailored experiences, CSPs need to adopt standard APIs like OpenAPI-TMF. These standards help everyone, from CSPs to vendors, speak the same technical language. That means simpler integration, quicker project delivery, and a smoother path to innovation.

## **2. Overview of Certified API**

The Resource Usage Management API provides a standardized interface for handling resource usage data, compliant with TMF771 specification. It supports the full lifecycle of ResourceUsage and ResourceUsageSpecification entities by enabling creation, update, retrieval, deletion, and event notification. This API is essential for tracking and rating usage generated by network and IT resources, and supports operations based on flexible query criteria.
