***TM Forum Open API Name and Release Version:***

*TMF635 – Product Usage Management v.5.0.0*

***Date: 09/07/2026***

# 1. What Product or Solution does your API support?

Entel's API Platform has encapsulated and instantiated the Product Usage Management API TMF635 to provide a standardized mechanism for the creation, update and retrieval of Product Usage records. A Product Usage entity represents the structured report of a service that has been delivered, guided by a corresponding Product Usage Specification, and is used to precisely track consumption for billing and rating purposes.

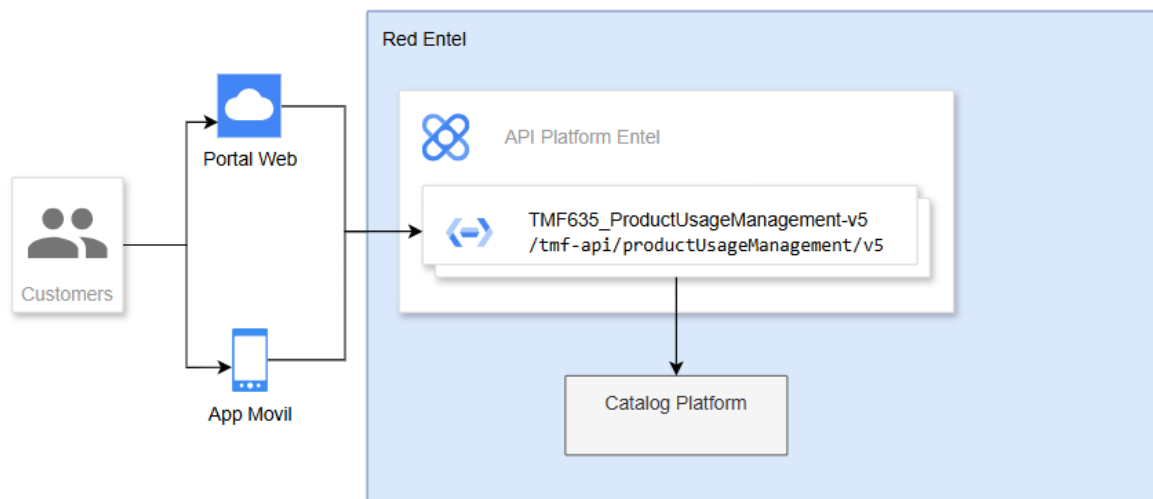

Communication Service Providers (CSPs) are constantly working to make their platforms more connected and adaptable. But every time a new feature is introduced, it often means building a new API or making changes to multiple systems. This slows down the launch process, making it harder to meet market demand and missing out on potential revenue.

To move faster and deliver better, more tailored experiences, CSPs need to adopt standard APIs like OpenAPI-TMF. These standards help everyone, from CSPs to vendors, speak the same technical language. That means simpler integration, quicker project delivery, and a smoother path to innovation.

## 2. Overview of Certified API

The Product Usage Management API provides a standardized interface for reporting and managing usage records, compliant with the TMF635 specification. It supports the creation of Product Usage records, partial updates via PATCH, individual and collection retrieval with field selection and filtering, and the initiation of asynchronous export jobs for bulk data extraction. Each Product Usage entity references the Product and Product Usage Specification it belongs to and carries a set of usage characteristics (name/value pairs) that describe the specifics of the consumption being reported. This API is essential for feeding downstream rating and billing systems with a consistent, well-structured record of service consumption.
