PUBLIC PARTICIPATION OPPORTUNITIES

The Virginia Beach Department of Public Utilities is part of the City of Virginia Beach municipal government.

The City Council meets on the first and third Tuesdays of each month except in July and December, when the meetings occur on the first and second Tuesdays. Agendas for upcoming meetings may be requested from the City Clerk's office at (757) 385-4303 or found online at virginiabeach.gov.

Clearly Defined

The Virginia Beach Annual Water Quality Report is our report card to you.

for 2022 data

Virginia Beach Public Utilities is committed to delivering safe, high-quality drinking water to your tap all day, every day. We are pleased to present you with this annual water quality report which contains information about your water and summarizes test results performed from January 1 through December 31, 2022. In this report, learn where your water comes from, how it is treated and tested, and how Virginia Beach water compares to federal and state standards.

Where Does My Water Come From?

Virginia Beach water comes from surface water treated at Norfolk's Moores Bridges Water Treatment Plant.

The mission of the Virginia Beach Department of Public Utilities is to provide a safe and sufficient water supply that will enhance and sustain our vibrant community. The Lake Gaston Water Supply Pipeline helps fulfill that mission by providing water to Virginia Beach citizens through a 76-mile-long pipeline leading from Lake Gaston in Brunswick County to Lake Prince, a reservoir located in Suffolk

but owned and operated by Norfolk. From the reservoirs, water is pumped to the treatment plant, where it undergoes an extensive filtering and disinfection process to remove any particles, bacteria, algae, and other impurities. The Moores Bridges Water Treatment Plant uses state-of-the-art treatment technology and ensures water quality through continual monitoring and testing.

Why Treat Water?

To ensure the water is clean and safe to drink.

The sources of drinking water (both tap water and bottled water) include lakes, ponds, reservoirs, rivers, springs, streams, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring organic and inorganic substances. Water also picks up contaminants from animals and human activity.

Disinfection is an essential part of the water treatment process, preventing the occurrence and spread of many water-borne diseases. Norfolk's Moores Bridges Water Treatment Plant treats our source water, testing it for 120 substances. Further testing is performed daily throughout Virginia Beach's water distribution system. An average of

273 water quality samples are collected and analyzed monthly, providing continual monitoring for the highest water quality possible.

Source Water Assessment

Your water is tested before and after it is treated to ensure it meets federal and state standards.

A source water assessment of our system has been conducted by the Hampton Roads Planning District Commission. This was done to determine the susceptibility to contamination of the surface water from which our drinking water originates. In Hampton Roads, all surface water sources were determined to be of high susceptibility to contamination using the criteria developed by the state. Areas that rely on surface water commonly receive this rating. However, Norfolk's Moores Bridges Water Treatment Plant tests and treats the water to meet federal drinking water standards.

The assessment report consists of maps showing the source water assessment area, a list of known land use activities of concern, and documentation of any known contamination. The report is available by contacting Don Piron at (757) 385-4171 or dpiron@vbgov.com.

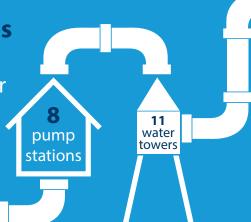

Average of **273** water quality samples are analyzed monthly

Drinking water is delivered to roughly 135,000 account holders

Virginia Beach Public Utilities

is committed to delivering safe, high-quality drinking water to your tap all day, every day.

through 1,674 miles of pipes

Nearly **32 million** gallons of water used throughout the City each day

Possible contaminants in untreated water:

The water treatment process removes these impurities and ensures the water is safe to drink.

- Microbial contaminants, such as viruses and bacteria, which
 may come from wildlife, pets, agricultural livestock operations,
 septic tanks, and sewage treatment plants. When ingested, these
 microscopic organisms can cause diarrhea, fever, and other
 gastrointestinal symptoms.
- **Inorganic contaminants**, such as salts and metals, which can be naturally-occurring or result from storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, storm water runoff, and residential use.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production and can also come from gas stations, storm water runoff, and septic systems.
- Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

Is the Water Safe for Everyone?

Virginia Beach water meets all Environmental Protection Agency drinking water standards. To ensure that tap water is safe to drink, the Environmental Protection Agency (EPA) has developed regulations limiting the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration (FDA) has established similar regulations for bottled water.

All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of these contaminants does not necessarily indicate that the water poses a health risk. However, some people may be more vulnerable than the general population to drinking water contaminants. Immunocompromised persons such as people undergoing chemotherapy, organ transplant recipients, people with HIV/AIDS or other immune system disorders, some elderly people, and infants can be particularly at risk for infections. These people, or those caring for them, should seek advice from their health care providers about their drinking water.

The EPA/CDC (Centers for Disease Control and Prevention) guidelines on reducing the risk of infection by cryptosporidium and microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791) or the EPA website at www.epa.gov/safewater.

WATER QUALITY DATA TABLE DEFINITIONS

Action Level or AL - The concentration of a contaminant that, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level or MCL - The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs (see definition below) as feasible by using the best available treatment technology.

Maximum Contaminant Level Goal or MCLG - The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety set by EPA.

Maximum Residual Disinfectant Level or MRDL

- The highest level of disinfectant allowed in the drinking water. There is convincing evidence that addition of a disinfectant is necessary for the control of microbial contaminants.

Maximum Residual Disinfectant Level Goal or MRDLG - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

NA - Not applicable.

ND - Not detected in the water.

Nephelometric Turbidity Unit or NTU - Units describing how cloudy a water sample appears. Turbidity is a good indicator of the effectiveness of our filtration system.

ppb (parts per billion) - Concentration in parts per billion, or micrograms per liter (μ g/L); this is equivalent to a single penny in \$10,000,000.

ppm (parts per million) - Concentration in parts per million, or milligrams per liter (mg/L); this is equivalent to a single penny in \$10,000.

Treatment Technique or TT - A required process intended to reduce the level of a contaminant in drinking water.

A message about lead in drinking water: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with a property's service lines and plumbing. Virginia Beach Public Utilities is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components.

When your water has been sitting in the water lines for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (1-800-426-4791) or at www.epa.gov/safewater/lead.

VIRGINIA BEACH WATER QUALITY DATA

JANUARY 1 THROUGH DECEMBER 31, 2022

Table	Substance		Likely	Source	Range	Average Level	Highest Level Detected	MCL	MCLG	UNIT	Meets EPA Standards
	Barium		Erosion of natural deposits		0.02 - 0.04	0.03	0.04	2	2	ppm	✓
nce	Fluoride		Added for prevention of tooth decay		0.1 - 0.9	0.5	0.9 ¹	4	4	ppm	✓

Sodium	Occurs naturally in the environment; also comes from the addition of treatment chemicals at the water treatment plant	30 - 40	35	40	250	ppm
	Natural in environment	101 - 132	116	132	500	ppm
Zinc	Occurs naturally in the environment; also comes from the addition of treatment chemicals at the water treatment plant	0.04 - 0.29	0.19	0.29	5	ppm

¹The highest monthly average for calendar year.

⁵ Monitoring unregulated substances helps the EPA to determine where certain contaminants occur and whether it needs to regulate those contaminants.

	•		<u>'</u>	•	
tion	Substance	Range	Average Level	UNIT	
orma	Alkalinity	26 - 47	35	ppm	
Additional Information	Ammonia	ND - 0.2	0.1	ppm	
lition	Hardness	48 - 67	58*	ppm	
Add	Silica	3 - 10	7	ppm	

⁶ EPA requires the Lead and Copper Table to reflect monitoring results for the period of January 1st, 2021 through December 31st, 2023. The state allows us to monitor for lead and copper less than once per year because the concentrations of these contaminants do not change frequently.

²The highest running average over four quarters at one location.

³The highest running average over four quarters.

⁴ For physician-prescribed "no salt diets," a limit of 20 ppm is suggested.

^{*} The water averages in the range between soft and slightly hard. This means there is enough hardness for soaps and detergents to work properly, yet not too much to interfere with most industrial applications. To find grains per gallon, divide ppm value by 17.
